Excel Dynamic Solutions (Pty) Ltd

## EXECUTIVE SUMMARY

Dalnek Minerals (Pty) Ltd (The Proponent), has applied to the Ministry of Mines and Energy (MME) for the Exclusive Prospecting License (EPL) No. 8685 on 19<sup>th</sup> November 2021. The approval and granting of EPL No. 8685 require an Environmental Clearance Certificate (ECC) before the commencement of the planned prospecting and exploration works. The 29544.7916-ha EPL is located about 60 km east of Okangwati, in the Kunene Region. The EPL covers (overlie) Kunene River Conservancy. The target commodities for EPL 8685 are **Base & Rare metals, Dimension Stone, Industrial Minerals, Precious Metals, and Semi-Precious Stones.**

Prospecting and exploration-related activities are among the listed activities that may not be undertaken without an ECC under the Environmental Impact Assessment (EIA) Regulations. Subsequently, to ensure that the proposed activity is compliant with the national environmental legislation, the project Proponent, appointed an independent environmental consultant, Excel Dynamic Solutions (Pty) Ltd to undertake the required Environmental Assessment (EA) process and apply for the ECC on their behalf.

The application for the ECC was compiled and submitted to the competent authority (Ministry of Environment, Forestry and Tourism (MEFT)) as the environmental custodian for project registration purposes. Upon submission of an Environmental Scoping Assessment (ESA) Report and Draft Environmental Management Plan (EMP), an ECC for the proposed project may be considered by the Environmental Commissioner at the MEFT's Department of Environmental Affairs and Forestry (DEAF).

### Brief Project Description

Planned Activities: Proposed Exploration Methods

The Proponent intends to adopt a systematic prospecting and exploration approach to the project as follows:

1. **Non-invasive Technique:**

- **Desktop Study: Geological mapping:** Mainly entails a desktop review of geological maps and ground observations. This includes the review of geological maps of the area and on-site ground traverses and observations and an update where relevant, of the information obtained during previous geological studies of the area and aero-geophysics survey.
- **Lithology geochemical surveys:** Rock and soil samples shall be collected and taken for trace element analysis to be conducted by analytical chemistry laboratories to determine if enough target commodities are present. Also, trenches or pits may be dug depending on the commodity (in a controlled environment e.g., fencing off and labeling activity sites) adopting a manual or excavator to further investigate the mineral potential. Soil sampling consists of small pits being dug where 1kg samples can be extracted and sieved to collect 50g of material. As necessary, and to ensure adequate risk mitigations, all major excavations will both be opened and closed immediately after obtaining the needed samples or the sites will be secured until the trenches or pits are closed. At all times, the farm owners and other relevant stakeholders will be engaged to obtain authorization where necessary.
- **Geophysical surveys:** This will entail data collection of the substrata (in most cases service of an aero-geophysical contractor will be sourced), by air or ground, through sensors such as radar, magnetic, and electromagnetic to detect any mineralization in the area to ascertain the mineralization. Ground geophysical surveys shall be conducted, where necessary using vehicle-mounted sensors or handheld by staff members, while in the case of air surveys, the sensors will be mounted to an aircraft, which then flies over the target area.

## 2. Invasive Technique:

Excel Dynamic Solutions (Pty) Ltd

- **Detailed Exploration Drilling (Invasive Technique):** Should analyses by an analytical laboratory be positive, holes are drilled, and drill samples collected for further analysis. This will determine the depth of the potential mineralization. If necessary new access tracks to the drill sites will be created and drill pads will be cleared in which to set up the rig. Two widely used drilling options may be adopted, these are either Reverse Circulation (RC) drilling and/or diamond drilling. RC drilling uses a pneumatic hammer, which drives a rotating tungsten-steel bit. The technique produces an uncontaminated large-volume sample, which is comprised of rock chips. It is relatively quicker and cheaper when compared to other techniques like Diamond Drilling. However, diamond drilling may also be considered for this exploration program, for better geological control and to perform processing trials. A typical drilling site will consist of a drill-rig, and support vehicles as well as a drill core and geological samples store. A drill core equipment parking and maintenance yard may be set up (including a fuel and lubricants storage facility).

## **Public Consultation**

### **Public Consultation Activities**

Regulation 21 of the EIA Regulations details steps to be taken during a public consultation process and these have been used in guiding this process. The public consultation process assisted the Environmental Consultant in identifying all potential impacts and aid in the process of identifying possible mitigation measures and alternatives to certain project activities. The communication with I&APs about the proposed prospecting and exploration activities was done through the following means in this order to ensure that the public is notified and allowed to comment on the proposed project:

- A Background Information Document (BID) containing information about the proposed exploration activities was compiled and delivered to relevant Authoritative Ministries, and upon request to all new registered Interested and Affected Parties (I&APs).

Excel Dynamic Solutions (Pty) Ltd

- Project Environmental Assessment notices were published in New Era Newspaper (02 March 2023 and 09 March 2023) and The Namibian Newspaper (03 March 2023 and 10 March 2023), briefly explaining the activity and its locality, inviting members of the public to register as I&APs and submit their comments/concerns.
- The issues and concerns raised were noted and used to form a basis for the ESA Report and EMP.

### **Potential Impacts identified**

The following potential impacts are anticipated:

- **Positive impacts:** Socio-economic development through employment creation (primary, secondary, and tertiary employment) and skills transfer; Opens up other investment opportunities and infrastructure-related development benefits; Produces a trained workforce and small businesses that can serve communities and may initiate related businesses; Boosts the local economic growth and regional economic development and; Increased support for local businesses through the procurement of consumable items such as Personal Protective Equipment (PPE), machinery spare parts, lubricants, etc.
- **Negative impacts:** Potential disturbance of existing pastoral systems; Physical land/soil disturbance; Impact on local biodiversity (fauna and flora); Habitat disturbance and potential illegal wildlife and domestic hunting in the area; Potential impact on water resources and soils particularly due to pollution; Air quality issue: potential dust generated from the project; Potential occupational health and safety risks, Vehicular traffic safety and impact on services infrastructures such as local roads, Vibrations, and noise associated with drilling activities may be a nuisance to locals; Environmental pollution (solid waste and wastewater), Archaeological and heritage impact and Potential social nuisance and conflicts (theft, damage to properties, etc.).

The potential negative impacts were assessed, and mitigation measures were provided accordingly.

Excel Dynamic Solutions (Pty) Ltd

## **CONCLUSIONS AND RECOMMENDATIONS**

### **Conclusions**

The potential impacts that are anticipated from the proposed project activities were identified, described, and assessed. For the significant adverse (negative) impacts with a medium rating, appropriate management, and mitigation measures were recommended for implementation by the Proponent, their contractors, and project-related employees.

The public was consulted as required by the EMA and its 2012 EIA Regulations (Sections 21 to 24). This was done via the two newspapers (New Era and The Namibian) used for this environmental assessment. A consultation through a face-to-face meeting with directly affected landowners at the EHOMBA (Big Tree next to the Ehomba Police Station (Referred to as the constituency office)), whereby they raised comments and concerns on the proposed project activities.

The issues and concerns raised by the registered I&APs formed the basis for this Report and the Draft EMP. The issues were addressed and incorporated into this Report whereby mitigation measures have been provided thereof to avoid and/or minimize their significance on the environmental and social components. Most of the potential impacts were found to be of medium-rating significance. With the effective implementation of the recommended management and mitigation measures, will particularly see a reduction in the significance of adverse impacts that cannot be avoided completely (from medium rating to low). To maintain the desirable rating, the implementation of management and mitigation measures should be monitored by the Proponent directly, or their Environmental Control Officer (ECO) is highly recommended. The monitoring of this implementation will not only be done to maintain the reduced impacts' rating or maintain a low rating but to also ensure that all potential impacts identified in this study and other impacts that might arise during implementation are properly identified in time and addressed right away too.

It is crucial for the proponents and their contractors as well as to effectively implement the recommended management and mitigation measures to protect both the biophysical and social environment throughout the project duration. All these would be done to promote environmental sustainability while ensuring a smooth and harmonious existence and purpose of the project activities in the community and environment at large.

## Recommendations

The Environmental Consultant is confident that the potential negative impacts associated with the proposed project activities can be managed and mitigated by the effective implementation of the recommended management and mitigation measures and with more effort and commitment put into monitoring the implementation of these measures.

It is, therefore, recommended that the proposed prospecting and exploration activities be granted an ECC, provided that:

- All the management and mitigation measures provided herein are effectively and progressively implemented.
- All required permits, licenses, and approvals for the proposed activities should be obtained as required. These include permits and licenses for land use access agreements to explore and ensure compliance with these specific legal requirements.
- The Proponent and all their project workers or contractors comply with the legal requirements governing their project and its associated activities and ensure that project permits and or approvals required to undertake specific site activities are obtained and renewed as stipulated by the issuing authorities.
- Site areas where exploration activities have ceased are rehabilitated, as far as practicable, to their pre-exploration state.
- Environmental Compliance monitoring reports should be compiled and submitted to the DEAF Portal as per the provision made on the MEFT/DEAF's portal.

## Disclaimer

Excel Dynamic Solutions (EDS) warrants that the findings and conclusion contained herein were accomplished following the methodologies outlined in the Scope of Work and Environmental Management Act (EMA) of 2007. These methodologies are described as representing good customary practice for conducting an EIA of a property to identify recognized environmental conditions. There is a possibility that even with the proper application of these methodologies there may exist subject property conditions that could not be identified within the scope of the

Excel Dynamic Solutions (Pty) Ltd

assessment, or which were not reasonably identifiable from the available information. The Consultant believes that the information obtained from the record review and during the public consultation processes concerning the proposed exploration work is reliable. However, the Consultant cannot and does not warrant or guarantee that the information provided by the other sources is accurate or complete. The conclusions and findings outlined in this report are strictly limited in time and scope to the date of the evaluations. No other warranties are implied or expressed.

Some of the information provided in this report is based on personal interviews, and research of available documents, records, and maps held by the appropriate government and private agencies. This report is subject to the limitations of historical documentation, availability, and accuracy of pertinent records, and the personal recollections of those persons contacted.

## DEFINITION OF TERMS

<b>Alternative</b>	A possible course of action, in place of another, would meet the same purpose and need of the proposal.
<b>Baseline</b>	Work done to collect and interpret information on the condition/trends of the existing environment.
<b>Biophysical</b>	That part of the environment does not originate with human activities (e.g. biological, physical, and chemical processes).
<b>Cumulative Impacts/Effects Assessment</b>	About an activity, means the impact of an activity that in it may not be significant but may become significant when added to the existing and potential impacts eventuating from similar or diverse activities or undertakings in the area.
<b>Decision-maker</b>	The person(s) entrusted with the responsibility for allocating resources or granting approval to a proposal.
<b>Ecological Processes</b>	Processes play an essential part in maintaining ecosystem integrity. Four fundamental ecological processes are the cycling of water, the cycling of nutrients, the flow of energy, and biological diversity (as an expression of evolution).
<b>Environment</b>	As defined in the Environmental Management Act - the complex of natural and anthropogenic factors and elements that are mutually interrelated and affect the ecological equilibrium and the quality of life, including – (a) the natural environment that is land, water, and air; all organic and inorganic matter and living organisms and (b) the human environment that is the landscape and natural, cultural, historical, aesthetic, economic and social heritage and values.

<b>Environmental Management Plan</b>	As defined in the EIA Regulations (Section 8(j)), a plan that describes how activities that may have significant environmental effects are to be mitigated, controlled, and monitored.
<b>Exclusive Prospecting Licence</b>	Is a license that confers exclusive mineral prospecting rights over the land of up to 1000 km <sup>2</sup> in size for an initial period of three years, renewable twice for a maximum of two years at a time
<b>Interested and Affected Party (I&amp;AP)</b>	Concerning the assessment of a listed activity includes - (a) any person, group of persons, or organization interested in or affected by the activity; and (b) any organ of state that may have jurisdiction over any aspect of the activity. Mitigate - practical measures to reduce adverse impacts. Proponent – as defined in the Environmental Management Act, a person who proposes to undertake a listed activity. Significant impact - means an impact that by its magnitude, duration, intensity, or probability of occurrence may have a notable effect on one or more aspects of the environment.
<b>Fauna</b>	All of the animals that are found in a given area.
<b>Flora</b>	All of the plants are found in a given area.
<b>Mitigation</b>	The purposeful implementation of decisions or activities that are designed to reduce the undesirable impacts of a proposed action on the affected environment.

<b>Monitoring</b>	Activity involving repeated observation, according to a pre-determined schedule, of one or more elements of the environment to detect their characteristics (status and trends).
<b>Nomadic Pastoralism</b>	Nomadic pastoralists live in societies in which the husbandry of grazing animals is viewed as an ideal way of making a living and the regular movement of all or part of the society is considered a normal and natural part of life. Pastoral nomadism is commonly found where climatic conditions produce seasonal pastures but cannot support sustained agriculture.
<b>Proponent</b>	Organization (private or public sector) or individual intending to implement a development proposal.
<b>Public Consultation/Involvement</b>	A range of techniques can be used to inform, consult or interact with stakeholders affected by the proposed activities.
<b>Protected Area</b>	Refers to a protected area that is proclaimed in the Government Gazette  according to the Nature Conservation Ordinance number 4 of 1975, as amended
<b>Scoping</b>	An early and open activity to identify the impacts that are most likely to be significant and require specialized investigation during the EIA work. Can, also be used to identify alternative project designs/sites to be assessed, obtain local knowledge of the site and surroundings, and prepare a plan for public involvement. The results of scoping are frequently used to

Excel Dynamic Solutions (Pty) Ltd

	prepare a Terms of Reference for the specialized input into full EIA.
<b>Terms of Reference (ToR)</b>	Written requirements governing full EIA input and implementation, consultations to be held, data to be produced, and form/contents of the EIA report. Often produced as an output from scoping.

# 1 INTRODUCTION

## 1.1 Project Background

Dalnek Minerals (Pty) Ltd (The Proponent), has applied to the Ministry of Mines and Energy (MME) for the Exclusive Prospecting License (EPL) 8685 on 19 November 2021. The approval and granting of EPL 8685 require an Environmental Clearance Certificate (ECC) before the commencement of the planned prospecting and exploration works. The 29544.7916-ha EPL is located about 60 km east of Okangwati, in the Kunene Region. The locality map is shown in **Figure 1**. The EPL covers (overlies) Kunene River Conservancy **Figure 13**. The commodities of interest are Base and Rare metals, Dimension Stone, Industrial Minerals, Precious Metals, and Semi-Precious Stones.

Section 27 (1) of the Environmental Management Act (EMA) (No. 7 of 2007) and its 2012 Environmental Impact Assessment (EIA) Regulations, provides a list of activities that may not be carried out without an EIA undertaken and an ECC obtained. Exploration activities are listed among activities that may not occur without an ECC. Therefore, individuals or organizations may not carry out exploration activities without an ECC awarded to the Proponent.

Excel Dynamic Solutions (Pty) Ltd

Figure 1: Locality map for EPL No. 8685

Dalnek Minerals (Pty) Ltd: EPL 8685

## 1.2 Terms of Reference, Scope of Works, and Appointed EA Practitioner

To satisfy the requirements of the EMA and its 2012 EIA Regulations, The Proponent appointed EDS to conduct the required Environmental Assessment (EA) process on their (Proponent's) behalf, and thereafter, apply for an ECC for exploration works on the EPL. There were no formal Terms of Reference (ToR) provided to EDS by the Proponent. The consultant, instead, relied on the requirements of the Environmental Management Act (No. 7 of 2007) (EMA) and its EIA Regulations (GN. No. 30 of 2012) to conduct the study.

The application for the ECC (**Appendix A**) is compiled and submitted to the Ministry of Environment, Forestry, and Tourism (MEFT), the environmental custodian for project registration purposes. Upon submission of an Environmental Scoping Assessment (ESA) Report and Draft Environmental Management Plan (EMP) (**Appendix B**), an ECC for the proposed project may be considered by the Environmental Commissioner at the MEFT Department of Environmental Affairs and Forestry (DEAF).

The EIA project is headed by Mr. Nerson Tjelos, a qualified and experienced Geoscientist and experienced EAP. The consultation process and reporting are done by Mr. Mandume Leonard and Reviewed by Ms. Rose Mtuleni. Mr. Nerson Tjelos CV is presented in **Appendix C**.

## 1.3 Motivation for the Proposed Project

The mining industry is one of the largest contributors to the Namibian economy, it contributes to the improvement of local livelihoods. In Namibia, the exploration of minerals is done mainly by the private sector. Exploration activities have a great potential to enhance and contribute to the development of other sectors and their activities do provide temporary employment, and taxes that fund social infrastructural development. The minerals sector yields foreign exchange and accounts for a significant portion of the gross domestic product (GDP). Additionally, the industry produces a trained workforce and small businesses that can serve communities and may initiate related businesses. Exploration activity fosters several associated activities such as the manufacturing of exploration and mining equipment, and the provision of engineering and environmental services. The mining sector forms a vital part of some of Namibia's development plans, namely: Vision 2030, National Development Plan 5 (NDP5), and Harambee Prosperity Plans (HPPs) I and II. Mining is essential to the development goals of Namibia in contributing to

Excel Dynamic Solutions (Pty) Ltd

meeting the ever-increasing global demand for minerals, and national prosperity. Successful exploration of EPL No. 8685 would lead to the mining of the target mineral, which would contribute towards achieving the goals of the national development plans.

## **2 PROJECT DESCRIPTION: PROPOSED EXPLORATION ACTIVITY**

Prospecting and exploration of minerals are the first components of any potential mining project. These are carried out to acquire the necessary data required for further decision-making and investment options. These activities are anticipated to last for about three years. The exploration process includes three phases - prospecting, exploration, and the decommissioning of works.

### **2.1 Prospecting Phase (Non-Invasive Techniques)**

#### **2.1.1 Desktop Study**

This mainly entails a desktop review of geological maps of the area, on-site ground traverses and observations, and an update, where relevant, of the information obtained during previous geological studies of the area.

#### **2.1.2 Geophysical surveys**

Geophysical surveys entail data collection of the substrata by air or ground, through sensors such as radar, magnetic, and/or electromagnetic sensors, to detect and ascertain any mineralization in the area. Ground geophysical surveys shall be conducted, where necessary, using vehicle-mounted sensors or handheld by staff members, while in the case of air surveys, the sensors are mounted to an aircraft, which navigates over the target area.

#### **2.1.3 Lithology geochemical surveys**

Rock and soil samples shall be collected and taken for trace element analysis to be conducted by analytical chemistry laboratories to determine the sufficiency of the mineral and the feasibility of mining the mineral. Additionally, trenches or pits may be dug depending on the commodity (in a controlled environment e.g., fencing off and labeling activity sites) adopting a manual or excavator to further investigate the mineral potential.

Soil sampling consists of small pits being dug, where 1kg samples can be extracted and sieved to collect about 50g of material. As necessary, and to ensure adequate risk mitigation, all major excavations will be closed immediately after obtaining the needed samples, or the sites will be secured until the trenches or pits are closed. The landowner and other relevant stakeholders will be engaged to obtain authorization where necessary.

## 2.2 Exploration (Drilling) Phase (Invasive techniques)

The selection of the potential mineralization model and exploration targets will be based on the local geology, and the trenching, drilling, and assay results of the samples collected. The planned exploration activities are aimed at delineating the mineral deposits and determining whether the deposits are economically feasible mining resources. **No explosives will be used during the exploration phase.**

### 2.2.1 Detailed Exploration (Drilling)

Should analyses by an analytical laboratory yield positive results, holes are drilled, and drill samples are collected for further analysis. This determines the depth of the potential mineralization. If necessary, new access tracks to the drill sites will be created and drill pads at which to set up the rig will be cleared. Two widely used drilling options may be adopted - the Reverse Circulation (RC) drilling method and/or the Diamond (Core) drilling method. The RC drilling method uses a pneumatic hammer, which drives a rotating tungsten-steel bit. RC Drilling produces an uncontaminated large-volume sample, which comprises rock chips. It is relatively quicker and cheaper when compared to other techniques like Diamond Drilling. However, diamond drilling may also be considered for this exploration program, for better geological control and to perform processing trials.

A typical drilling site consists of a drill rig and support vehicles as well as a drill core and geological samples store. A drill equipment parking and maintenance yard may be set up (including a fuel and lubricants storage facility).

*Other aspects of the proposed exploration operations include:*

### 2.2.2 Accessibility to Site

The EPL is located within Epupa Constituency, near Okangwati. It is accessible via the C43 Road from Okongwati, which connects to D3701 and D3702 leading to the EPL area. Project-related vehicles will use existing roads to access the EPL. It is also anticipated that, if necessary, new tracks to the different targeted exploration sites within the EPL will be created. The Proponent may need to do some upgrading on the site access roads to ensure that it is fit to accommodate project-related vehicles, such as heavy trucks.

### 2.2.3 Material and Equipment

The requirements of the exploration program in terms of vehicles and equipment include (4X4) vehicles, a truck, water tanks, drill rigs and drilling machines, and a power generator. Equipment and vehicles will be stored at a designated area near the accommodation site or a storage site established within the EPL area.

### 2.2.4 Services and Infrastructure

- **Water:** Water for the exploration operations on the EPL will be obtained from the nearest existing boreholes, or the proponent will drill boreholes within the EPL, upon obtaining necessary permits and signed agreements with the landowners or traditional authorities in the area. The estimated monthly water consumption is 4 500 liters. This includes water for drinking, sanitation, cooking, dust control (if necessary), drilling, as well as washing of equipment.
- **Power supply:** Power required during the operation phase will be provided by diesel generators. About 2000 liters of diesel will be used per day.
- **Fuel (diesel for generators and other equipment):** The fuel (diesel) required for exploration equipment will be stored in a tank mounted on a mobile trailer, and drip trays will be readily available on this trailer and monitored to ensure that accidental fuel spills are cleaned up as soon as they have been detected/observed. Fuel may also be stored in a bunded diesel bowser on site, and in jerry cans placed on plastic sheeting to avoid unnecessary contamination of soils.

### 2.2.5 Waste Management

The site will be equipped with secured waste bins for each type of waste (i.e., domestic, hazardous, and recyclable). Depending on the amount generated, waste will be sorted and collected as regularly as possible and taken to the nearest certified landfill site. An agreement will need to be reached with different waste management facility operators/owners and authorization or permits will be obtained before utilizing these facilities, in the case of production of any hazardous waste.

- **Sanitation and human waste:** Portable chemical ablution facilities will be used, and the sewage will be disposed of according to the approved disposal or treatment methods of the waste products.

Excel Dynamic Solutions (Pty) Ltd

- **Hazardous waste:** Drip trays and spill control kits will be available on-site to ensure that oil/fuel spills and leaks from vehicles and equipment are captured on time and contained correctly before polluting the site.

The waste produced on-site can also be categorized as mineral or non-mineral waste:

- **Mineral Waste:** Consists of solid products of exploration and mineral concentration to acquire the target minerals. Mineral waste will potentially be produced throughout the project exploration phase. This waste will be stripped and dumped in allocated areas as stipulated in the EMP.
- **Non-mineral Waste:** Consists primarily of auxiliary materials that will support the exploration phase. This includes but is not limited to items such as empty containers, plastic, etc., and other domestic waste. This waste will be collected, sorted, and taken to the dumpsite as regularly as necessary.

### 2.2.6 Safety and Security

- **Storage Site:** Temporary storage areas for exploration material, equipment, and machinery will be required at the campsite and/or exploration sites. Security will be supplied on a 24-hour basis at the delegated sites for storage. A temporary support fence surrounding the storage site will be constructed to ensure people and domestic animals are not put at risk.
- **Fire management:** A minimum of basic firefighting equipment, i.e., fire extinguishers will be readily available in vehicles, at the working sites and camps. The exploration crew is required to have the contact details of the nearest fire station at hand in case of a larger scale of fires at the site.
- **Health and Safety:** Adequate and appropriate Personal Protective Equipment (PPE) will be provided to every project personnel while on and working at the site. A first aid kit will be readily available on-site to attend to potential minor injuries.

### 2.2.7 Accommodation

The exploration crew will be accommodated in Okangwati/Opuwo, or a campsite will be set up for the exploration crew near the exploration sites. If the accommodation camp is to be set up on a farm, necessary arrangements will be made with the farm owner(s). Exploration activities will take

Excel Dynamic Solutions (Pty) Ltd

place during daytime only and staff will commute to the exploration site(s) from their place of accommodation if they are not accommodated on site.

### **2.3 Decommissioning and Rehabilitation Phase**

Once the exploration activities on the EPL come to an end, the Proponent will need to put site rehabilitation measures in place. Decommissioning and rehabilitation are primarily reinforced through a decommissioning and rehabilitation plan, which consists of safety, health, environmental, and contingency aspects. An unfavorable economic situation or unconvincing exploration results might force the Proponent to cease the exploration program before the predicted closure. Therefore, it is best practice for the Proponent to ensure the project activities cease in an environmentally friendly manner and the site is rehabilitated.

### **3 PROJECT ALTERNATIVES**

Alternatives are defined as the “different means of meeting the general purpose and requirements of the activity” (EMA, 2007). This section highlights the different ways in which the project can be undertaken and identifies alternatives that may be the most practical, but least damaging to the environment.

Once the alternatives have been established, these are examined by asking the following three questions:

- What alternatives are technically and economically feasible?
- What are the environmental effects associated with the feasible alternatives?
- What is the rationale for selecting the preferred alternative?

The alternatives considered for the proposed development are discussed in the following subsections.

#### **3.1 Types of Alternatives Considered**

##### **3.1.1 The "No-go" Alternative**

The “no action” alternative implies that the status quo remains, and nothing happens. Should the proposal of exploration activities on the EPL, be discontinued, none of the potential impacts (positive and negative) identified would occur. If the proposed project is to be discontinued, the current land use for the proposed site will remain unchanged.

This no-go option is considered and a comparative assessment of the environmental and socio-economic impacts of the “no action” alternative, is undertaken to establish what benefits might be lost if the project is not implemented. The key losses that may never be realized if the proposed project does not go ahead include:

- Loss of foreign direct investment.
- About ten (5-10) temporary job opportunities for community members will not be realized.
- No realization of local business supports through the procurement of consumable items such as Personal Protective Equipment (PPE), machinery spare parts, lubricants, etc.

Excel Dynamic Solutions (Pty) Ltd

- Loss of potential income to the local and national government through land lease fees, license lease fees, and various tax structures.
- Improved geological understanding of the site area regarding the targeted commodities.
- Socio-economic benefits such as skills acquisition for local community members would be not realized.

Considering the above losses, the “no-action/go” alternative may not necessarily be considered a viable option for this project, although, in the case where parts of the project site are considered environmentally sensitive and/or protected, one or several sections of the site may be identified as no-go zones.

### **3.1.2 Exploration Location**

The prospecting/exploration location is dependent on the geological setting (regional and local), the economic geology, and the exploration and mining history of the EPL area. Therefore, finding an alternative location for the planned exploration activities is not possible. This means that the mineralization of the target commodities is area-specific, and exploration targets are primarily determined by the geology (host rocks) and the tectonic environment of the site (an ore-forming mechanism)). The tenement has a sufficient surface area for future related facilities, should an economic mineral deposit be defined.

Furthermore, the national mineral resources’ potential locations are also mapped and categorized by the Ministry of Mines and Energy, on exclusive prospecting licenses, mining licenses and claims, mineral deposit retention licenses, reconnaissance licenses, and exclusive reconnaissance licenses. Available information on EPL (**Figure 2**) and other licenses are available on the Namibia Mining Cadastral Map here <https://portals.landfolio.com/namibia/>

Figure 2: The location of EPL 8685 on the National Mining Cadastre

### 3.1.3 Exploration Methods

Invasive and non-invasive exploration techniques are expected to be used for exploration works. If an economically viable discovery is made, the project will proceed to the mining phase upon approval of a mining EIA and issuance of a mining license. If any other alternative viable exploration methods are found to achieve the purpose more effectively and/or efficiently without aggravating any environmental measures put in place, they can be implemented.

**Table 3-1: Presentation of pitting, and trenching as well as comparison of reverse circulation and diamond drilling methods**

<b>Invasive Exploration Method (Alternatives Considered)</b>	<b>Short Description</b>	<b>Justification for the selected option</b>
<p><b>Pitting and trenching</b></p>	<p>-Pits and trenches, or to use the old Cornish mining term, costeans, can be a quick, cheap way of obtaining lithological and structural information in areas of shallow cover.</p> <p>-Pitting is usually employed to test shallow, extensive, flat-lying bodies of mineralization. An ideal example of this would be a buried heavy mineral placer.</p> <p>-The main advantage of pitting over a pattern-drill program on the same deposit is that pits can provide a very large volume sample. Large sample sizes are necessary to overcome problems of variable grade distribution, which are characteristic features of such deposits.</p> <p>-Trenches are usually employed to expose steep dipping bedrock buried below shallow overburden and are normally</p>	<p>- Quick, cheap way of obtaining lithological and structural information in areas of shallow cover.</p> <p>-Pits can provide a very large volume sample. Large sample sizes are necessary to overcome problems of variable grade distribution, which are characteristic features of such deposits.</p> <p>-Trenches are an excellent adjunct to RC drilling programs, where the structural data from trench mapping are needed to complement the lithological information obtained from the drill cuttings (Marjoribanks, 1997).</p>

Invasive Exploration Method (Alternatives Considered)	Short Description	Justification for the selected option
	<p>dug across the strike of the rocks or mineral zone being tested (Marjoribanks, 1997).</p>	
<p><b>Reverse Circulation (RC)</b></p>	<p>-Crushed rock is collected in the form of cuttings samples called back within stems contrast to conventional drilling that puts the air inside the stems and cuttings outside. Here the air passes downwards through the annular space between the inner shaft and the outer tube.</p> <p>-Water is often used down the hole to cool the drill bit and reduce dust as well as assist with the transportation of sample bits to the surface.</p>	<p>-Compared to diamond drilling, RC requires less water. Therefore, RC drilling will put less pressure on the water supply and use.</p> <p>The major differences between RC and diamond drilling are in the rate of penetration and cost per foot. RVC drilling</p>

Invasive Exploration Method (Alternatives Considered)	Short Description	Justification for the selected option
	<p>-RC drilling is designed for drilling through and crushing hard rock.</p> <p>-RC is fundamentally different from diamond core drilling, both in terms of equipment and sampling. One major difference is that RVC drilling creates small rock chips instead of a solid core.</p> <p>Furthermore, according to Technidrill (2020), the RC method:</p> <ul style="list-style-type: none"> <li>-Allows full recovery of samples continuously</li> <li>-Quick installation</li> <li>-There is no contact between the walls and cuttings taken at the bottom.</li> <li>-The penetration rate is fast (Technidrill, 2020)</li> </ul>	<p>is much faster than diamond core drilling and much less expensive.</p> <p>-Unlike diamond drilling, this process creates rock chips that can be analyzed, rather than a solid, cylindrical piece of rock.</p> <p>-Some types of information, such as structural details, are not possible to obtain in the absence of solid rock. Despite this disadvantage, much valuable information can still be obtained from the rock chips. For example, the chips are much easier to examine under a microscope. Testing of fluorescence and effervescence is easily</p>

Invasive Exploration Method (Alternatives Considered)	Short Description	Justification for the selected option
<p><b>Infill drilling</b></p>	<p>The progress of an exploration project mostly depends on the result of the primary boreholes. Therefore, primary exploration boreholes must intersect high-grade mineralization zones with considerable thickness. On the other hand, the infill boreholes are designed based on obtained results from the primary boreholes (Fatehi, <i>et al.</i>, 2017). Therefore, infill drilling is intended to support an update to a higher classification of the Mineral Resource estimate. The metallurgical test-work results will improve the understanding of blending designs in the exploration schedules for the product offtake specifications (Canyon Resources, 2021).</p>	<p>accomplished (Earth Science Australia, 2020).</p> <p>It is for these reasons that RC will be the most preferred method and mainly used. However, the RC drilling would be combined with Diamond drilling where necessary for more reliable data collection and analysis. Diamond drilling would more applicable where deeper holes are required than is possible using RC drilling.</p>
<p><b>Diamond (Core) drilling</b></p>	<p>-Diamond core drilling uses a diamond bit, which rotates at the end of the drill rod (or pipe). The opening at the end of the diamond bit allows a solid column of rock to move up into the drill pipe and be recovered at the surface.</p>	<p>-In-fill drilling would also be applied to support an update to a higher classification of the Mineral Resource estimate.</p>

Invasive Exploration Method (Alternatives Considered)	Short Description	Justification for the selected option
	<p>-The diamond bit is rotated slowly with gentle pressure while being lubricated with water to prevent overheating. As a result, this drilling method is known to use a huge amount of water compared to RC, thus may put pressure on water supply sources.</p> <p>-While the drill cuttings obtained with RC drilling can be analyzed to provide a limited amount of information, the scope of these tests is limited, and their locations are less precise. Core samples, on the other hand, will identify actual veins of materials and give you their precise location (BG Drilling, 2016). Therefore, for accuracy's sake, diamond drilling would provide a better result. In other words, RC results are reliable but may not be accurate.</p> <p>- As diamond is one of the strongest materials in the world, it has no trouble drilling through most surfaces. Therefore, it</p>	

<b>Invasive Exploration Method (Alternatives Considered)</b>	<b>Short Description</b>	<b>Justification for the selected option</b>
	works well across a wider range of ground types and conditions.  -Time-consuming and more effort is required to obtain the drill core. -Low initial investment, but generally more expensive to meters drilled because of the limitation of the speed.	

The final drilling technique would be determined by the mineralization type. However, based on the information presented in the drilling methods table above, it was found and pre-determined that Reverse Circulation (RC) drilling would be preferable as much as possible given its efficiency in terms of costs, operating speed and environmentally friendly (water demand) compared to Diamond drilling (which not likely to be used for this proposed exploration).

Although RC drilling is known to have its shortcomings, particularly lack of solid drill recovery and inaccuracy, it is usually combined with Diamond drilling for the exploration of some minerals, if the borehole(s) needs to be deeper than what RC can achieve.

## 4 LEGAL FRAMEWORK: LEGISLATION, POLICIES, AND GUIDELINES

Prospecting and exploration activities have legal implications associated with certain applicable legal standards. A summary of applicable and relevant international policies and Namibian legislation, policies, and guidelines for the proposed development is given in this section (**Table 1**). This summary serves to inform the project Proponent, Interested and Affected Parties, and the decision-makers at the DEAF, of the requirements and expectations, as laid out in terms of these instruments, to be fulfilled to establish the proposed prospecting and exploration activities.

### 4.1 The Environmental Management Act (No. 7 of 2007)

This EIA was carried out according to the Environmental Management Act (EMA) and its Environmental Impact Assessment (EIA) Regulations (GG No. 4878 GN No. 30).

The EMA has stipulated requirements to complete the required documentation to obtain an ECC for permission to undertake certain listed activities. These activities are listed under the following Regulations:

*3.1 The construction of facilities for any process or activities which requires a license, the right of other forms of authorization, and the renewal of a license, right, or other forms of authorization, in terms of the Minerals (Prospecting and Mining Act, 1992).*

*3.2 other forms of mining or extraction of any natural resources whether regulated by law or not.*

*3.3 Resource extraction, manipulation, conservation, and related activities.*

The Environmental Impact Assessment (EIA) Regulations GN 28-30 (GG 4878) detail requirements for public consultation within a given environmental assessment process (GN 30 S21). The EIA regulations also outline the required details of a Scoping Report (GN 30 S8) and an Assessment Report (GN 30 S15).

Other legal obligations that are relevant to the proposed activities of EPL No. 8685 and related activities are presented.

**Table 4-1: Applicable local, national, and international standards, policies, and guidelines governing the proposed development**

<b>Legislation / Policy / Guideline: Custodian</b>	<b>Relevant Provisions</b>	<b>Implications for this project</b>
<p>The Constitution of the Republic of Namibia, 1990 as amended:</p> <p><b>Government of the Republic of Namibia</b></p>	<p>The Constitution of the Republic of Namibia (1990 as amended) addresses matters relating to environmental protection and sustainable development.</p> <p>Article 91(c) defines the functions of the Ombudsman to include:</p> <p>“...the duty to investigate complaints concerning the over-utilization of living natural resources, the irrational exploitation of non-renewable resources, the degradation and destruction of ecosystems and failure to protect the beauty and character of Namibia...”</p> <p>Article 95(l) commits the state to actively promoting and maintaining the welfare of the people by adopting policies aimed at the:</p> <p>“...Natural resources situated in the soil and on the subsoil, the internal waters, in the sea, in the continental shelf, and in</p>	<p>By implementing the environmental management plan, the establishment will be conformant to the constitution in terms of environmental management and sustainability.</p> <p>Ecological sustainability will be the main priority for the proposed development.</p>

	<p>the exclusive economic zone are property of the State.”</p>	
<p>Minerals (Prospecting and Mining) Act (No. 33 of 1992): <b>Ministry of Mines and Energy (MME)</b></p>	<p>Section 52 requires mineral license holders to enter into a written agreement with affected landowners before exercising rights conferred upon the license holder.</p> <p>Section 52(1) mineral license holder may not exercise his/her rights in any town or village, on or in a proclaimed road, land utilized for cultivation, within 100m of any water resource (borehole, dam, spring, drinking trough, etc.) and boreholes, or no operations in municipal areas, etc.), which should individually be checked to ensure compliance.</p> <p>Section 54 requires a written notice to be submitted to the Mining Commissioner if the holder of a mineral license intends to abandon the mineral license area.</p> <p>Section 68 stipulates that an application for an exclusive prospecting license (EPL) shall contain the particulars of the condition of, and any existing damage to, the environment in the area to which the application relates and an estimate of</p>	<p>The Proponent should enter into a written agreement with landowners before exploring their land. On communal land, the Proponent should engage the Traditional Authorities for land use consent.</p> <p>An assessment of the impact on the receiving environment should be carried out.</p> <p>The Proponent should include as part of their application for the EPL, measures by which they will rehabilitate the areas where they intend to carry out mineral exploration activities.</p> <p>The Proponent may not carry out exploration activities within the areas limited by Section 52 (1) of this Act.</p>

<b>Legislation / Policy / Guideline: Custodian</b>	<b>Relevant Provisions</b>	<b>Implications for this project</b>
	<p>the effect which the proposed prospecting operations may have on the environment and the measures to be taken to prevent or minimize any such effect.</p> <p>Section 91 requires that rehabilitation measures should be included in an application for a mineral license.</p>	
<p>Nature Conservation Amendment Act, No. 3 of 2017: <b>Ministry of Environment, Forestry and Tourism (MEFT)</b></p>	<p>National Parks are established and gazetted following the Nature Conservation Ordinance, 1975 (4 of 1975), as amended. The Ordinance provides a legal framework concerning the permission of entering a state-protected area, as well as requirements for individuals damaging objects (geological, ethnological, archaeological, and historical) within a protected area. Though the Ordinance does not specifically refer to mining as an activity within a protected area (PA) or recreational area (RA), it does restrict access to PAs and prohibits certain acts therein as well as the purposes for which permission to enter game parks and nature reserves may be granted.</p>	<p>The Proponent will be required to enhance the conservation of biodiversity and the maintenance of the ecological integrity of protected areas and other State land in the Project Site area.</p> <p>The Proponent will also be required to comply with the existing and planned local operational management plans, regulations, and guidelines of the three conservancies.</p>

<b>Legislation / Policy / Guideline: Custodian</b>	<b>Relevant Provisions</b>	<b>Implications for this project</b>
<p>The Parks and Wildlife Management Bill of 2008: <b>Ministry of Environment, Forestry and Tourism (MEFT)</b></p>	<p>Aims to provide a regulatory framework for the protection, conservation, and rehabilitation of species and ecosystems, the sustainable use and sustainable management of indigenous biological resources, and the management of protected areas, to conserve biodiversity and contribute to national development.</p>	
<p>Mine Health &amp; Safety Regulations, 10th Draft: <b>Ministry of Health and Social Services (MHSS)</b></p>	<p>Makes provision for the health and safety of persons employed or otherwise present in the mineral licenses area. These deal with among other matters; clothing and devices; design, use, operation, supervision, and control of machinery; fencing and guards; and safety measures during repairs and maintenance.</p>	<p>The Proponent should comply with all these regulations concerning their employees.</p>
<p>Petroleum Products and Energy Act (No. 13 of 1990) Regulations (2001): <b>Ministry of Mines and Energy (MME)</b></p>	<p>Regulation 3(2)(b) states that “No person shall possess [sic] or store any fuel except under the authority of a license or a certificate, excluding a person who possesses or stores such fuel in a quantity of 600 liters or less in any container kept at a place outside a local authority area”</p>	<p>The Proponent should obtain the necessary authorization from the MME for the storage of fuel on-site.</p>

<b>Legislation / Policy / Guideline: Custodian</b>	<b>Relevant Provisions</b>	<b>Implications for this project</b>
<p>The Regional Councils Act (No. 22 of 1992): <b>Ministry of Urban and Rural Development (MURD)</b></p>	<p>This Act sets out the conditions under which Regional Councils must be elected and administer each delineated region. From a land use and project planning perspective, their duties include, as described in section 28 “to undertake the planning of the development of the region for which it has been established with a view to physical, social and economic characteristics, urbanization patterns, natural resources, economic development potential, infrastructure, land utilization pattern and sensitivity of the natural environment.</p>	<p>The relevant Regional Councils are IAPs and must be consulted during the Environmental Assessment (EA) process. The project site falls under the Kunene Regional Council; therefore, they should be consulted.</p>
<p>Traditional Authority Act (Act No. 25 of 2000): <b>Ministry of Urban and Rural Development (MURD)</b></p>	<p>The Act also stipulates that Traditional Authorities (TAs) should ensure that natural resources are used on a sustainable basis that conserves the ecosystem. This Act implies that TAs must be fully involved in the planning of land use and development for their area. It is the responsibility of the TA’s customary leadership, the Chiefs, to exercise control on behalf of the state</p>	<p>The EPL considered under this project is predominantly located in Epupa Constituency which is mainly communal land. Therefore, the traditional leaders and community members should be consulted throughout the Project.</p>

<b>Legislation / Policy / Guideline: Custodian</b>	<b>Relevant Provisions</b>	<b>Implications for this project</b>
	<p>and the residents in their designated area.</p>	
<p>Water Act 54 of 1956: <b>Ministry of Agriculture, Water and Land Reform (MAWLR)</b></p>	<p>The Water Resources Management Act 11 of 2013 is present without regulations; therefore, the Water Act No 54 of 1956 is still in force:</p> <p>Prohibits the pollution of water and implements the principle that a person disposing of effluent or waste has a duty of care to prevent pollution (S3 (k)).</p> <p>Provides for control and protection of groundwater (S66 (1), (d (ii))).</p> <p>Liability of clean-up costs after closure/abandonment of an activity (S3 (l)). (l)).</p>	<p>The protection (both quality and quantity/abstraction) of water resources should be a priority.</p> <p>The permits and license required thereto should be obtained from MAWLR's relevant Departments (these permits include Borehole Drilling Permits, Groundwater Abstraction &amp; Use Permits, and when required, Wastewater / Effluent Discharge Permits).</p>
<p>Water Resources Management Act (No 11 of 2013): <b>Ministry of Agriculture, Water and Land Reform (MAWLR)</b></p>	<p>The Act provides for the management, protection, development, use, and conservation of water resources; provides for the regulation and monitoring of water services, and provides for incidental matters. The objects of this Act are to:</p> <p>Ensure that the water resources of Namibia are managed, developed, used, conserved, and protected in a manner</p>	

<b>Legislation / Policy / Guideline: Custodian</b>	<b>Relevant Provisions</b>	<b>Implications for this project</b>
	<p>consistent with, or conducive to, the fundamental principles set out in Section 66 - protection of aquifers, Subsection 1 (d) (iii) provide for preventing the contamination of the aquifer and water pollution control (S68).</p>	
<p>National Heritage Act No. 27 of 2004: <b>Ministry of Education, Arts, and Culture (MEAC)</b></p>	<p>To provide for the protection and conservation of places and objects of heritage significance and the registration of such places and objects; to establish a National Heritage Council; to establish a National Heritage Register; and to provide for incidental matters.</p>	<p>The Proponent should ensure compliance with this act's requirements. The necessary management measures and related permitting requirements must be taken. This is done by consulting with the National Heritage Council (NHC) of Namibia. The management measures should be incorporated into the Draft EMP.</p>
<p>The National Monuments Act (No. 28 of 1969): <b>Ministry of Education, Arts, and Culture (MEAC)</b></p>	<p>The Act enables the proclamation of national monuments and protects archaeological sites.</p>	<p>Duty of care must be applied to soil conservation and management measures must be included in the EMP.</p>
<p>Soil Conservation Act (No 76 of 1969): <b>Ministry of Agriculture, Water and Land</b></p>	<p>The Act makes provision for the prevention and control of soil erosion and the protection, improvement, and conservation of soil, vegetation, and water supply sources and resources,</p>	<p>Duty of care must be applied to soil conservation and management measures must be included in the EMP.</p>

<b>Legislation / Policy / Guideline: Custodian</b>	<b>Relevant Provisions</b>	<b>Implications for this project</b>
<b>Reform (MAWLR)</b>	through directives declared by the Minister.	
<b>Forestry Act (Act No. 12 of 2001): Ministry of Environment, Forestry and Tourism (MEFT)</b>	<p>The Act provides for the management and use of forests and forest products.</p> <p>Section 22. (1) provides: “Unless otherwise authorized by this Act, or by a license issued under subsection (3), no person shall on any land which is not part of a surveyed erven of a local authority area as defined in section 1 of the Local Authorities Act, 1992 (Act No. 23 of 1992) cut, destroy or remove - (a) vegetation which is on a dune or drifting sand or a gully unless the cutting, destruction or removal is done to stabilize the sand or gully; or (b) any living tree, bush or shrub growing within 100 m of a river, stream or watercourse.”</p>	<p>The proponent will apply for the relevant permit under this Act if it becomes necessary.</p>
<b>Public Health Act (No. 36 of 1919): Ministry of Health and Social Services (MHSS)</b>	<p>Section 119 states that “no person shall cause a nuisance or shall suffer to exist on any land or premises owned or occupied by him or of which he is in charge any nuisance or other condition liable to be injurious or dangerous to health.”</p>	<p>The Proponent and all its employees should ensure compliance with the provisions of these legal instruments.</p>

<b>Legislation / Policy / Guideline: Custodian</b>	<b>Relevant Provisions</b>	<b>Implications for this project</b>
Health and Safety Regulations GN 156/1997 (GG 1617): <b>Ministry of Health and Social Services (MHSS)</b>	Details various requirements regarding the health and safety of labourers.	
Public and Environmental Health Act No. 1 of 2015: <b>Ministry of Health and Social Services (MHSS)</b>	The Act serves to protect the public from nuisance and states that no person shall cause a nuisance or shall suffer to exist on any land or premises owned or occupied by him or of which he is in charge any nuisance or other condition liable to be injurious or dangerous to health.	The Proponent should ensure that the project infrastructure, vehicles, equipment, and machinery are designed and operated in a way that is safe, or not injurious or dangerous to public health and that the noise and dust emissions which could be considered a nuisance remain at acceptable levels.  Public and environmental health should be preserved and remain uncompromised.
Atmospheric Pollution Prevention Ordinance (1976): <b>Ministry of</b>	This ordinance provides for the prevention of air pollution and is affected by the Health Act 21 of 1988. Under this ordinance, the entire area of Namibia, apart from East Caprivi, is proclaimed as	The proposed project and related activities should be undertaken in such a way that they do not pollute or compromise the surrounding

## 4.2 International Policies, Principles, Standards, Treaties, and Conventions

The international policies, principles, standards, treaties, and conventions applicable to the project are listed in Table 4-2 below.

**Table 4-2: International Policies, Principles, Standards, Treaties, and Convention Applicable to the Project**

Statute	Provisions	Project Implications
<p><b>Equator Principles</b></p>	<p>A financial industry benchmark for determining, assessing, and managing environmental and social risk in projects (August 2013). The Equator Principles have been developed in conjunction with the International Finance Corporation (IFC), to establish an International Standard with which companies must comply to apply for approved funding by Equator Principles Financial Institutions (EPFIs). The principles apply to all new project financings globally across all sectors.</p> <p>Principle 1: Review and Categorization</p> <p>Principle 2: Environmental and Social Assessment</p> <p>Principle 3: Applicable Environmental and Social Standards</p> <p>Principle 4: Environmental and Social Management System and Equator Principles Action Plan</p> <p>Principle 5: Stakeholder Engagement</p> <p>Principle 6: Grievance Mechanism</p> <p>Principle 7: Independent Review</p> <p>Principle 8: Covenants</p> <p>Principle 9: Independent Monitoring and Reporting</p>	<p>These principles are an attempt to: ‘...encourage the development of socially responsible projects, which subscribe to appropriately responsible environmental management practices with a minimum negative impact on project-affected ecosystems and community-based upliftment and empowering interactions.’</p>

Statute	Provisions	Project Implications
	Principle 10: Reporting and Transparency	
<p><b>The International Finance Corporation (IFC) Performance Standards</b></p>	<p>The International Finance Corporation’s (IFC) Sustainability Framework articulates the Corporation’s strategic commitment to sustainable development and is an integral part of the IFC’s approach to risk management. The Sustainability Framework comprises IFC’s Policy and Performance Standards on Environmental and Social Sustainability, and IFC’s Access to Information Policy. The Policy on Environmental and Social Sustainability describes IFC’s commitments, roles, and responsibilities related to environmental and social sustainability.</p> <p>As of 28 October 2018, there are ten (10) Performance Standards (Performance Standards on Environmental and Social Sustainability) that the IFC requires project Proponents to meet throughout the life of an investment. These standard requirements are briefly described below.</p> <p>Performance Standard 1: Assessment and Management of Environmental and Social Risks and Impacts</p>	<p>The Performance Standards are directed toward clients, guiding how to identify risks and impacts, and are designed to help avoid, mitigate, and manage risks and impacts as a way of doing business sustainably, including stakeholder engagement and disclosure obligations of the Client (Borrower) concerning project-level activities. In the case of its direct investments (including project and corporate finance provided through financial intermediaries), IFC requires its clients to apply the Performance Standards to manage environmental and social risks and impacts so that development opportunities are enhanced. IFC uses the</p>

Excel Dynamic Solutions (Pty) Ltd

## 5 ENVIRONMENTAL BASELINE

The proposed exploration program will be undertaken in specific environmental and social conditions. Understanding the pre-project conditions of the environment will aid in laying down background "information" on the status quo and future projections of environmental conditions after proposed works on the EPL. This also helps the EAP in identifying the sensitive environmental features that may need to be protected through the recommendations and effective implementation of mitigation measures provided.

The baseline information presented below is sourced from a variety of sources including reports of studies conducted in the Kunene Region. Further information was obtained by the Consultant during a site visit conducted on 24 March, 2023.

### 5.1 Biophysical Environment

#### 5.1.1 Climate

Climate has a major influence on the exploration activities proposed on the EPL. An understanding of climatic conditions helps to determine the appropriate and/or inappropriate times to conduct exploration activities.

High temperatures around the project area are mainly experienced between September and December, at an average of 35.9<sup>0</sup> C; and the lowest temperatures are experienced at an average of 12.16<sup>0</sup> C in June and July. The highest average rainfall of 153.41 mm is experienced in January, and the lowest average rainfall (0 mm) is experienced from June - August. **Figure 3** shows the general climate of the Okangwati (Ehomba) area.

Month	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Nov	Oct	Dec	Year
Record high °C (°F)	42.27 (108.09)	41.22 (106.2)	39.1 (102.38)	35.93 (96.67)	33.82 (92.88)	30.65 (87.17)	31.7 (89.06)	36.99 (98.58)	41.22 (106.2)	44.39 (111.9)	46.5 (115.7)	41.22 (106.2)	46.5 (115.7)
Average high °C (°F)	34.17 (93.51)	33.63 (92.53)	32.44 (90.39)	31.29 (88.32)	29.62 (85.32)	26.8 (80.24)	27.11 (80.8)	31.2 (88.16)	35.42 (95.76)	37.52 (99.54)	35.87 (96.57)	34.76 (94.57)	32.49 (90.48)
Daily mean °C (°F)	30.27 (86.49)	29.39 (84.9)	28.55 (83.39)	27.11 (80.8)	24.73 (76.51)	21.19 (70.14)	21.15 (70.07)	25.13 (77.23)	29.78 (85.6)	32.62 (90.72)	32.01 (89.62)	31.06 (87.91)	27.75 (81.95)
Average low °C (°F)	23.29 (73.92)	22.32 (72.18)	22.02 (71.64)	20.33 (68.59)	16.97 (62.55)	12.41 (54.34)	11.9 (53.42)	15.34 (59.61)	19.51 (67.12)	22.22 (72.0)	23.88 (74.98)	23.8 (74.84)	19.5 (67.1)
Record low °C (°F)	16.91 (62.44)	16.91 (62.44)	16.91 (62.44)	13.74 (56.73)	10.57 (51.03)	5.28 (41.5)	5.28 (41.5)	7.4 (45.32)	9.51 (49.12)	12.68 (54.82)	15.85 (60.53)	15.85 (60.53)	5.28 (41.5)
Average precipitation mm (inches)	153.41 (6.04)	131.78 (5.19)	136.21 (5.36)	31.31 (1.23)	1.11 (0.04)	0.0 (0)	0.0 (0)	0.22 (0.01)	1.66 (0.07)	15.06 (0.59)	74.13 (2.92)	133.39 (5.25)	56.53 (2.23)
Average precipitation days (≥ 1.0 mm)	17.1	15.57	17.29	6.63	0.19	0.0	0.0	0.19	0.48	4.7	11.91	15.38	7.45

Figure 3: Shows the climate condition around the project area, Epupa Constituency (source: Okangwati climate: Climate-Data.org)

## 5.1.2 Landscape

The EPL area is dominated by the Karstveld and the Kunene Hill landscapes, The Karstveld landscape is characterized by the dissolution of soluble rocks such as limestone, dolomite, or gypsum. This process results in the formation of unique landforms, such as sinkholes, caves, and underground drainage systems. They are often associated with underground water systems, and as such, they are important sources of groundwater. Karst aquifers supply drinking water to approximately 25% of the world's population (Ford & Williams, 2007).

The Kunene Hill landscape is a unique topographic feature located in northwestern Namibia. It is characterized by a series of steep hills and valleys formed by erosion and weathering of volcanic rocks over millions of years. According to Hartmann et al (2016), the Kunene Hill landscape is "a rugged, mountainous terrain, featuring spectacular rock formations and unique plant and animal life" (p. 77).

The Kunene Hill landscape is an important biodiversity hotspot, home to a variety of endemic and endangered species. It is also an important cultural and spiritual site for the Himba people, who have lived in the area for generations (Ravenelle, 2018).

Excel Dynamic Solutions (Pty) Ltd

The elevation of the project area is about 900m – 1850 m above sea level. **Figure 4**, below shows the landscape map (a) and the topographic map (b).

(a)

Excel Dynamic Solutions (Pty) Ltd

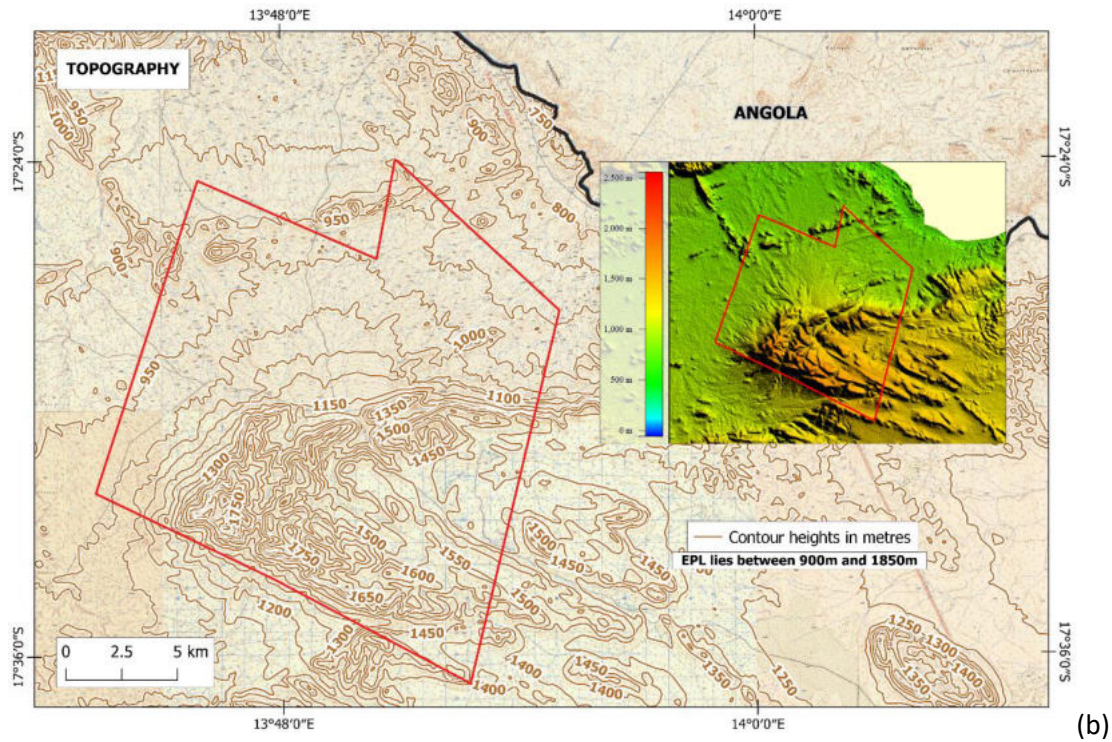

Figure 4: Landscape map (a) and Topographic map (b) of the project area

Figure 5: Shows the view of the landscape within the EPL area.

### 5.1.3 Geology

The geology of the Kunene region is characterized by a combination of igneous, metamorphic, and sedimentary rocks, which have been exposed and eroded over millions of years. The area is also known for its mineral deposits, including copper, zinc, and lead (Saria, Lekhanya, and Mapani, 2014).

Near Ehomba village, the geology is dominated by volcanic rocks, particularly basalt, and rhyolite. These rocks were formed by ancient volcanic eruptions and subsequent cooling and solidification. Basalt is typically dark in color and has a fine-grained texture, while rhyolite is lighter in color and has a coarser texture (Hartmann, Karger, and Wieczorek 2016).

The volcanic rocks in the area have undergone extensive weathering and erosion over time, resulting in a variety of unique landforms, including hills, valleys, and canyons. The landscape is also characterized by a variety of rock formations, such as columns, pillars, and arches, which have been sculpted by wind and water (Schneider and Gresse 2007).

**Figure 6** below shows the general geology map for the project.

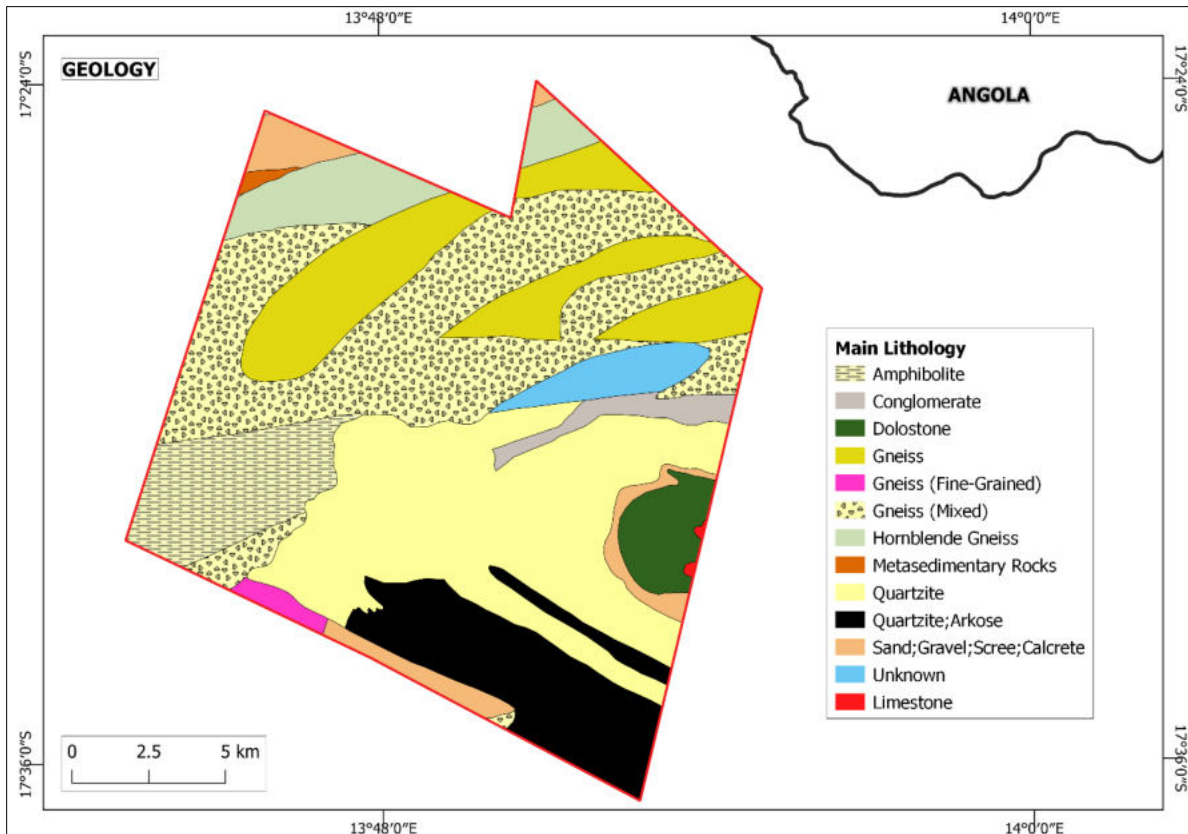

Figure 6: A map of the general geology of the project area

#### 5.1.4 Soil

The EPL is dominated by Rock Outcrops and Chromic Cambisols. The rock outcrop in the Kunene Region is a geologically significant formation that offers a glimpse into the region's geological history. According to Kruger et al. (2013), the outcrop is part of the Damara Orogen, which formed during the Proterozoic era between 2.0 and 0.6 billion years ago. The Damara Orogen is characterized by its complex geological structure, which includes folded and faulted rocks as well as large-scale intrusions of granitic and gabbroic rocks (Kruger et al., 2013).

The Rock Outcrops are composed of a variety of rocks, including schist, quartzite, and gneiss (Kruger et al., 2013). These rocks were originally sedimentary or volcanic in origin but were transformed through heat and pressure during the formation of the Damara Orogen (Kruger et al., 2013). The outcrops also contain evidence of tectonic activity, including faulting and folding, which

are indicative of the intense deformation that occurred during the orogeny (Kruger et al., 2013). The rock outcrops in the Kunene Region provides a window into the complex geological history of the Damara Orogen. Its composition and structure offer valuable insights into the processes that shaped the region over billions of years.

Chromic Cambisols are characterized by a high content of iron and aluminum oxides, low levels of organic matter, and a low cation exchange capacity. It is typically found in areas with low rainfall and is often associated with poor agricultural productivity. Chromic Cambisols in the Kunene Region are also prone to erosion and nutrient leaching due to its sandy texture and low soil organic matter content (Mwange et al., 2019). **Figure 7** below shows the soil types found within the EPL area.

Figure 7: shows the dominant soil types found within the EPL

Figure 8: Shows the soil types dominating the EPL area observed on site

### 5.1.5 Hydrology, Groundwater Vulnerability to Pollution, and Water Resources

The source of surface water around or within the EPL is the smaller ephemeral rivers and streams, which are tributaries to the main Kunene River. Their flow and availability depend on seasonal rainfall. In terms of groundwater, the EPL is mainly covered by rock bodies with little groundwater potential and a small part east of the EPL is covered by Fractured, fissured, or Karstified aquifer.

This means that the EPL falls within a zone of rather low vulnerability to Moderate sensitivity (Vulnerability) to groundwater pollution. **Figure 8** shows the hydrology, Groundwater Vulnerability to Pollution, and Groundwater- Aquifer Maps of the EPL area.

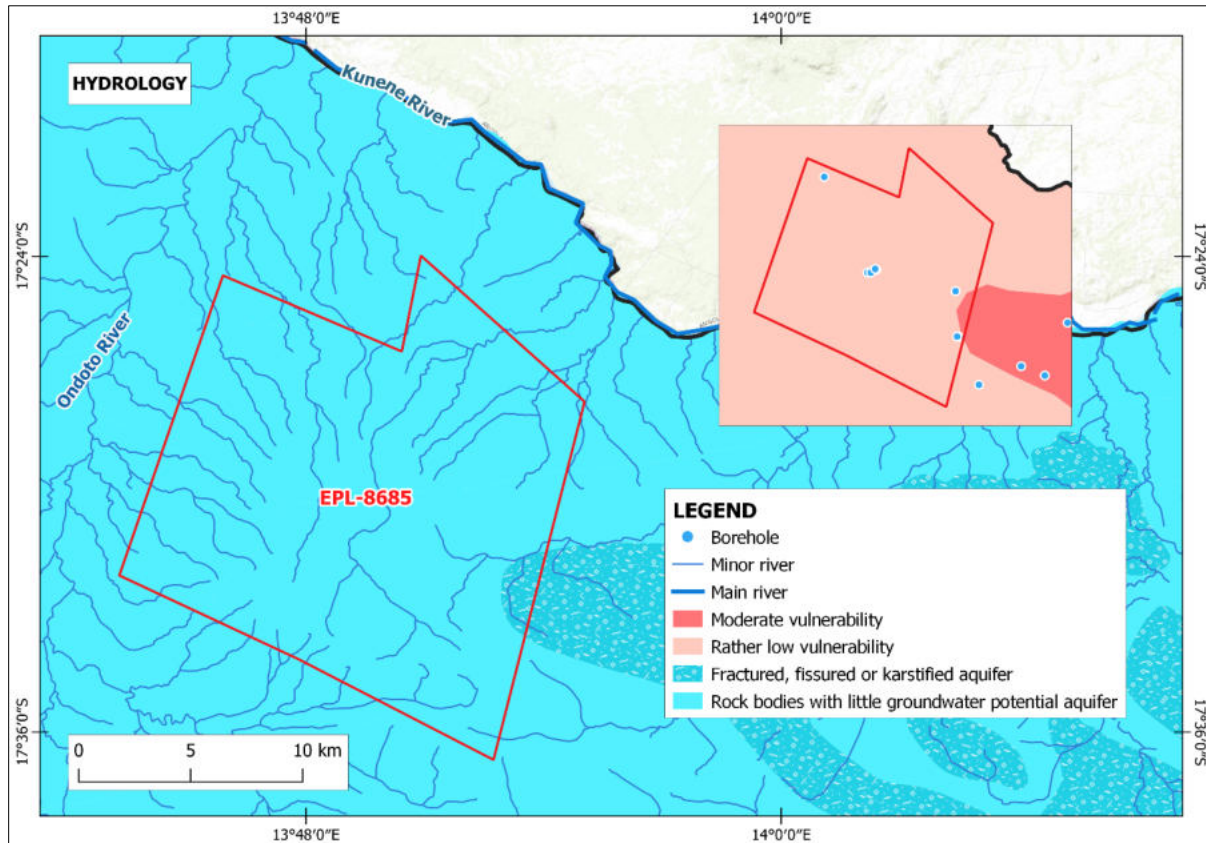

Figure 9: shows the hydrology map and groundwater vulnerability to pollution map of the project area.

Figure 10: Shows Surface water (natural springs) located within the project area.

## 5.1.6 Flora and Fauna

### 5.1.6.1 Flora

The project area is dominated by the mixed woodland of the Ruacana Escarpment, the western section of the EPL is dominated by the shrubland of the Cunene valley, while the Mixed broad-leaved shrubs of northern-central plateau cover a small part southwest of the EPL.

The Ruacana Escarpment forms part of the Kaokoveld Plateau. The area is characterized by rugged terrain, with cliffs, rocky outcrops, and deep gorges. The mixed woodland of the Ruacana Escarpment is a unique and diverse ecosystem characterized by a combination of trees and shrubs adapted to the arid conditions of the region. The woodland is dominated by species such as *Terminalia sericea*, *Burkea africana*, and *Combretum apiculatum*, with other species such as *Acacia tortilis*, *Commiphora africana*, and *Tamarix usneoides* also present (Mukarobgwa et al., 2021). The mixed woodland of the Ruacana Escarpment is found on the slopes and in the valleys of the escarpment, with the vegetation varying depending on the altitude and aspect of the slope.

The mixed woodland plays an important role in supporting local wildlife and providing ecosystem services such as soil conservation, carbon sequestration, and water regulation. However, the area is also facing threats from overgrazing, land-use changes, and climate change, which are affecting the biodiversity and functioning of the ecosystem.

The shrubland of the Cunene Valley is characterized by a diverse assemblage of shrubs and grasses adapted to the semi-arid conditions of the region. The shrubland is dominated by species such as *Acacia erioloba*, *Ziziphus mucronata*, *Colophospermum mopane*, *Grewia flava*, *Tamarix usneoides*, *Acacia mellifera*, and *Boscia albitrunca* (Muvengwi et al., 2019). The Cunene Valley covers part of the Namibian border with Angola. The area is characterized by a semi-arid climate, with low and erratic rainfall, and is prone to droughts and water scarcity. The shrubland is found on the valley floor and the lower slopes of the surrounding hills, with the vegetation varying depending on the soil type and water availability.

The mixed broad-leaved shrubland of the northern-central plateau in Namibia is a unique ecosystem characterized by a mix of broad-leaved shrubs, grasses, and herbs adapted to the semi-arid conditions of the region.

Excel Dynamic Solutions (Pty) Ltd

Figure 12 below shows the vegetation observed during the site visit on the EPL area.

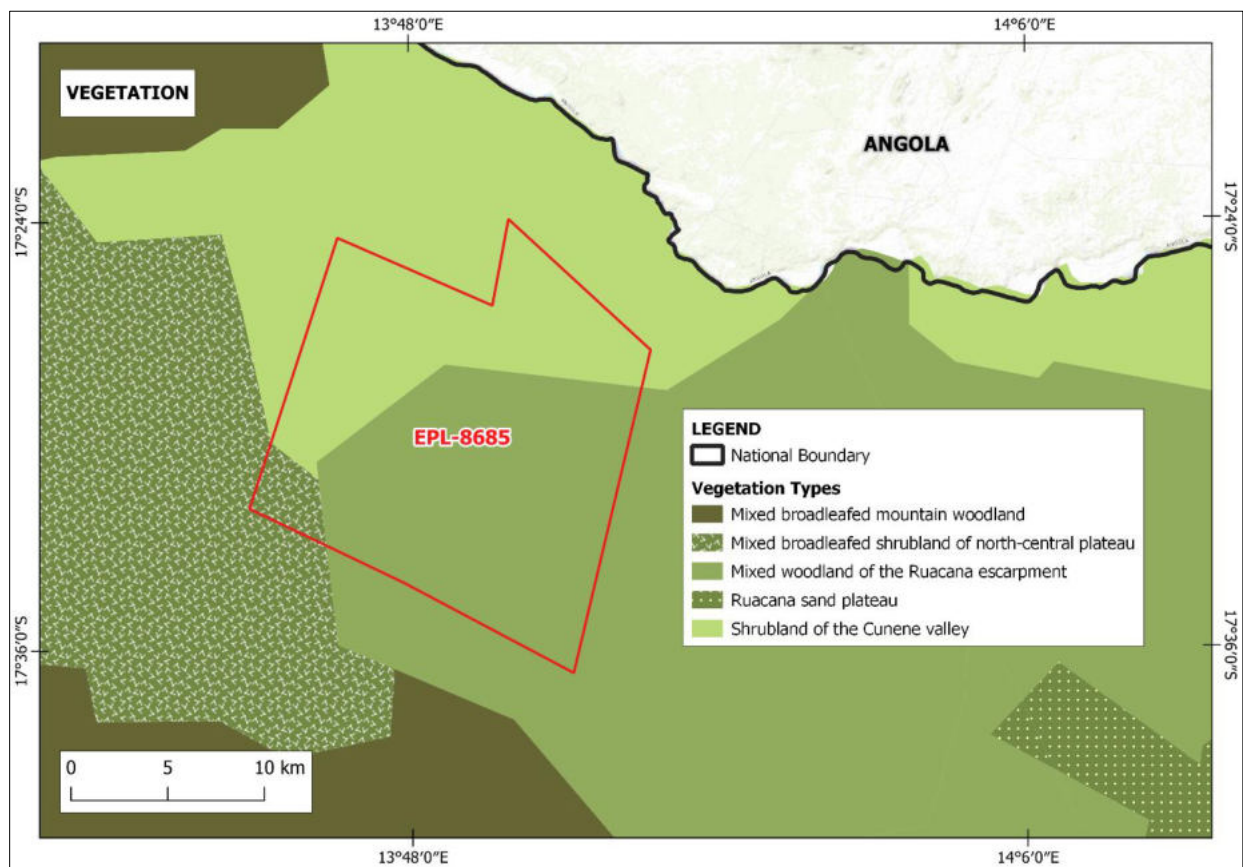

Figure 11: Vegetation Map

Excel Dynamic Solutions (Pty) Ltd

Figure 12: Vegetation observed during the site visit.

Excel Dynamic Solutions (Pty) Ltd

### 5.1.6.2 Fauna

During the site visit, wild animals were observed on site (**Figure 13**). The EPL area has wildlife such as monkeys, zebras, hyenas, springboks, ostriches, kudus, leopards, and also livestock such as sheep, cattle, goats, donkeys, and horses.

Figure 13: Evidence of the faunal presence

## 5.2 Heritage and Archaeology

### 5.2.1 Local Level and Archaeological Findings

Archaeological sites in Namibia are protected under the National Heritage Act of 2004 (No. 27 of 2004). Evidence shows that the emergence of modern humans and their ancestors have lived in Namibia for more than one million years, and there are fossil remains of lineal hominin ancestors as early as the Miocene Epoch (Kinahan, 2017). Namibia has a relatively complete sequence

Excel Dynamic Solutions (Pty) Ltd

covering the mid-Pleistocene to the Recent Holocene period, represented by thousands of archaeological sites mainly concentrated in the central highlands, escarpment, and the Namib Desert.

Abundant evidence has been found of human occupation since at least the mid-Pleistocene (Shackley, 1985). The Kunene Region is among the archaeologically sensitive landscapes in Namibia. The region is home to 7 declared national monuments in the country and other non-designated archaeological sites, making it archaeologically and historically sensitive. This suggests the possibility of the discovery of more archaeologically significant resources during the earthworks. **Figure 14** shows archaeologically significant sites observed on different farms on the EPL.

Excel Dynamic Solutions (Pty) Ltd

Figure 14: Archaeological sites observed on the EPL

Excel Dynamic Solutions (Pty) Ltd

### 5.3 Surrounding Land Uses

The EPL falls within a communal land area as shown in **Figure 15**. The Proponent is required to secure a signed agreement from the affected landowners/traditional authorities to gain access to the areas of interest for prospecting and exploration investigations as per Section 52 of the Minerals (Prospecting and Mining) Act No. 33 of 1992 and Section 2.2.3 of the Minerals Policy of Namibia.

1. Section 52 (1) The holder of the mineral license shall not exercise any rights conferred upon such holder by this Act or under any terms and conditions of such mineral license –
  - (a) In, on, or under any and until the such holder has agreed in writing with the owner of such land containing terms and conditions relating to the payment of compensation, or the owner of such land has in writing waived any right to such compensation and has submitted a copy of such agreement or waiver to the Commissioner.

Section 2.2.3 of the Draft Minerals Policy of Namibia states that the License Holder and/or mineral explorers currently have to negotiate a contract with landowners to gain access for mining purposes.

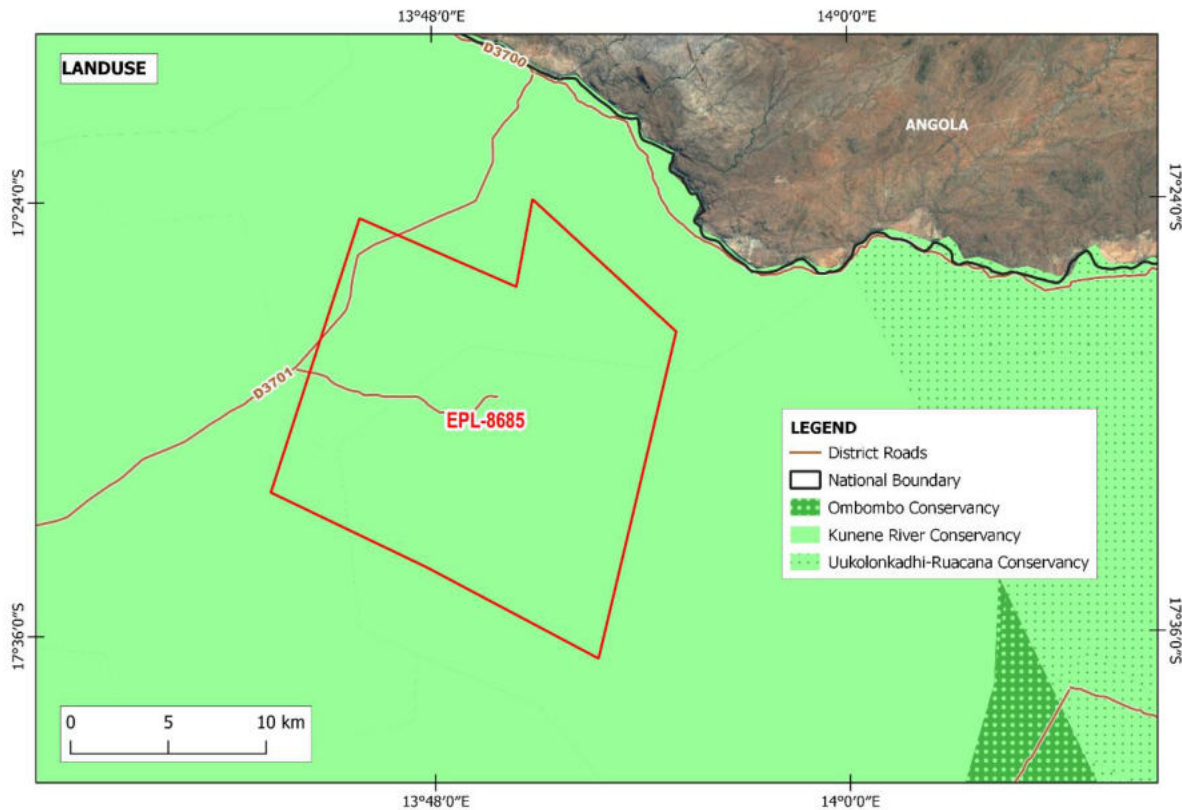

Figure 15: Land use map

## 5.4 Socio-Economic conditions

### 5.4.1 Population

According to the 2011 Namibian Statistics Agency Population and Housing Census, the Epupa Constituency had a population of 17 696, and Okangwati, within the Epupa Constituency approximately 554.

### 5.4.2 Farming

Farming and Agricultural activities in Epupa Constituency rely on rainfall and some irrigation projects. The project area is characterized by livestock farming on communal land.

Excel Dynamic Solutions (Pty) Ltd

### **5.4.3 Tourism**

Okanguati Settlement is the gateway to Epupa Falls and it has the potential to grow as a tourist destination, accommodation, and tourism facilities are constructed in the settlement. Other Areas for potential investment include Tourism Facilities (Lodges, Hostels, and Camping sites).

### **5.4.4 Mining**

There is a high potential for mineral deposits in the Kunene Region. There has been mining activities in the Kunene Region for over 50 years, and mining has gained new momentum with the enactment of the Minerals Act (MA) of 1992 and the act of 1996 that granted usufruct rights to local communities.

### **5.4.5 Services Infrastructure**

The services activities provided in Kunene Region including Okangwati range from educational, health, financial, Tourism, Transport, and other administrative services provided by the government and related offices.

### 5.4.6 Other infrastructures

Figure 16: Show some infrastructure found within the EPL area

## 6 PUBLIC CONSULTATION PROCESS

Public consultation is an important component of an Environmental Assessment (EA) process. It provides potential Interested and Affected Parties (I&APs) with an opportunity to comment on and raise any issues relevant to the project for consideration as part of the assessment process, thus assisting the Environmental Assessment Practitioner (EAP) in identifying all potential impacts and what extent further investigations are necessary. Public consultation can also aid in the process of identifying possible mitigation measures. Public consultation for this scoping study has been done following the EMA and its EIA Regulations.

## 6.1 Pre-identified and Registered Interested and Affected Parties (I&APs)

Relevant and applicable national, regional, and local authorities, local leaders, and other interested members of the public were identified. Pre-identified I&APs were contacted directly, while other parties who contacted the Consultant after project advertisement notices in the newspapers, were registered as I&APs upon their request. Newspaper advertisements of the proposed exploration activities were placed in two widely read national newspapers in the region (New Era Newspaper and The Namibian Newspaper). The project advertisement/announcement ran for two consecutive weeks inviting members of the public to register as I&APs and submit their comments. The summary of pre-identified and registered I&APs is listed in **Table 5-1** below and the complete list of I&APs is provided in **Appendix D**.

**Table 5-1: Summary of Interested and Affected Parties (I&APs)**

<b>National (Ministries and State-Owned Enterprises)</b>
Ministry of Environment, Forestry, and Tourism
Ministry of Mines and Energy
Ministry of Health and Social Services
<b>Regional, Local, and Traditional Authorities</b>
Kunene Regional Council
Epupa Constituency
<b>General Public</b>
Landowners /Interested members of the public
Namibia Community-Based Tourism Association

## 6.2 Communication with I&APs

Regulation 21 of the EIA Regulations details the steps to be taken during a public consultation process and these have been used in guiding this process. Communication with I&APs concerning the proposed development was facilitated through the following means and in this order:

Excel Dynamic Solutions (Pty) Ltd

- A Background Information Document (BID) containing brief information about the proposed exploration works was compiled and delivered to relevant Authoritative Ministries, and upon request to all new registered Interested and Affected Parties (I&APs);
- Project Environmental Assessment notices were published in the New Era Newspaper (**02 March 2023 and 09 March 2023**) and The Namibian Newspaper (**03 March 2023 and 10 March 2023**), briefly explaining the activity and its locality and inviting members of the public to register as I&APs and submit their comments/concerns.
- Public notices were placed at a public place the Big Tree in Ehomba Village (**Figure 17**) to inform members of the public about the EIA process.
- Public meetings were scheduled and held on **24 March 2023**, at Ehomba Village in the big tree next to the police station (the tree referred to as the Constituency office) (**Figure 18**).

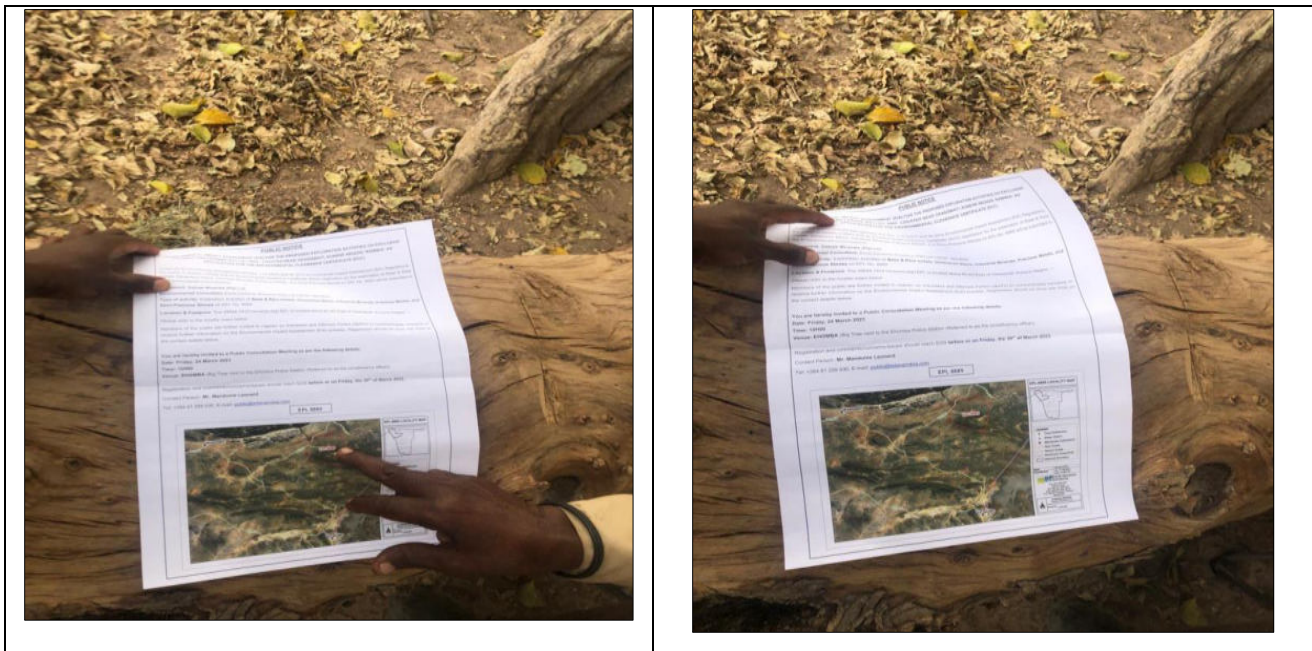

Figure 17: Public notices placed at the Big Tree in Ehomba Village, Kunene Region

**Figure 18: Public Consultation meeting under the Big Tree in Ehomba Village**

Issues raised by I&APs have been recorded and incorporated in the environmental report and EMP. The summarized issues raised during the public meeting are presented in **Table 5-2** below. The issues raised and responses by EDS are attached under **Appendix D**

**Table 5-2: Summary of main issues raised, and comments received during public meeting engagements**

Issue	Concern
Small Scale Miners in the Area	Can the owner of the Exclusive Prospecting License (EPL) help with mining claims of small scale miners in the area,
The negative impacts of Exploration activities	Was the community contacted before regarding this EPL or this is the first time you are contacting them?
The awarding of the consent letter and traditional leaders' conflict.	Did the proponent meet all the traditional leaders, to agree about, awarding a consent letter regarding this EPL?

	<p>The awarding of the consent letter for the EPL was done in Oroutumba village by the traditional leaders, and they did not inform the community members from Ehomba village. As community members, we cannot see transparency in this.</p>
--	--

## 7 IMPACT IDENTIFICATION, ASSESSMENT, AND MITIGATION MEASURES

### 7.1 Impact Identification

Proposed developments/activities are usually associated with different potential positive and/or negative impacts. For an environmental assessment, the focus is placed mainly on the negative impacts. This is done to ensure that these impacts are addressed by providing adequate mitigation measures such that an impact's significance is brought under control while maximizing the positive impacts of the development. The potential positive and negative impacts that have been identified from the prospecting activities are listed as follows:

Positive impacts:

- Creation of jobs for the locals (primary, secondary, and tertiary employment).
- Producing a trained workforce and small businesses that can service communities and may initiate related businesses.
- Boosting local economic growth and regional economic development.
- Open up other investment opportunities and infrastructure-related development benefits.

Negative impacts:

- Disturbance to grazing areas

Excel Dynamic Solutions (Pty) Ltd

- Land degradation and Biodiversity Loss.
- Generation of dust
- Water Resources Use
- Soil & Water Resources Pollution
- Waste Generation
- Occupational Health & Safety risks
- Vehicular Traffic Use & Safety
- Noise & Vibrations
- Disturbance to Archaeological & Heritage Resources
- Impacts on Local Roads
- Social Nuisance: local property intrusion & disturbance
- Social Nuisance: Job seeking & differing Norms, Culture & values
- Impacts associated with closure and decommissioning of exploration works

## 7.2 Impact Assessment Methodology

The Environmental Assessment process primarily ensures that potential impacts that may occur from project activity are identified and addressed with environmentally cautious approaches and legal compliance. The impact assessment method used for this project is following Namibia's Environmental Management Act (No. 7 of 2007) and its Regulations of 2012, as well as the International Finance Corporation (IFC) Performance Standards.

The identified impacts were assessed in terms of scale/extent (spatial scale), duration (temporal scale), magnitude (severity), and probability (likelihood of occurring), as presented in **Table 7-1**, **Table 7-2**, **Table 7-3**, and **Table 7-4**, respectively.

To enable a scientific approach to the determination of the environmental significance, a numerical value is linked to each rating scale. This methodology ensures uniformity and that potential impacts can be addressed in a standard manner so that a wide range of impacts are comparable. It is assumed that an assessment of the significance of a potential impact is a good indicator of the risk associated with such an impact. The following process will be applied to each potential impact:

- Provision of a brief explanation of the impact.

- Assessment of the pre-mitigation significance of the impact; and
- Description of recommended mitigation measures.

The recommended mitigation measures prescribed for each of the potential impacts contribute towards the attainment of environmentally sustainable operational conditions of the project for various features of the biophysical and social environment. The following criteria were applied in this impact assessment:

### 7.2.1 Extent (spatial scale)

The extent is an indication of the physical and spatial scale of the impact. **Table 7-1** shows the rating of impact in terms of the extent of spatial scale.

**Table 7-1: Extent or spatial impact rating**

Low (1)	Low/Medium (2)	Medium (3)	Medium/High (4)	High (5)
The impact is localized within the site boundary: Site only	The impact is beyond the site boundary: Local	Impacts felt within adjacent biophysical and social environments: Regional	Impact widespread far beyond site boundary: Regional	The impact extends National or international boundaries

### 7.2.2 Duration

Duration refers to the timeframe over which the impact is expected to occur, measured concerning the lifetime of the project. **Table 7-2** shows the rating of impact in terms of duration.

**Table 7-2: Duration impact rating**

Low (1)	Low/Medium (2)	Medium (3)	Medium/High (4)	High (5)
Immediate mitigating measures, immediate progress	The impact is quickly reversible, and short-term impacts (0-5 years)	Reversible over time; medium-term (5-15 years)	Impact is long-term	Long-term; beyond closure; permanent; irreplaceable or irretrievable commitment of resources

### 7.2.3 Intensity, Magnitude/severity

Intensity refers to the degree or magnitude to which the impact alters the functioning of an element of the environment. The magnitude of alteration can either be positive or negative. These ratings were also taken into consideration during the assessment of severity. **Table 7-3** shows the rating of impact in terms of intensity, magnitude, or severity.

**Table 7-3: Intensity, magnitude, or severity impact rating**

Type of criteria	Negative				
	H- (10)	M/H- (8)	M- (6)	M/L- (4)	L- (2)
<b>Qualitative</b>	Very high deterioration, high quantity of deaths, injury or illness / total loss of habitat, total alteration of ecological processes, extinction of rare species	Substantial deterioration, death, illness or injury, loss of habitat/diversity or resource, severe alteration or disturbance of important processes	Moderate deterioration, discomfort, partial loss of habitat/biodiversity or resource, moderate alteration	Low deterioration, slight noticeable alteration in habitat and biodiversity. Little loss in species numbers	Minor deterioration, nuisance or irritation, minor change in species/habitat/diversity or resource, no or very little quality deterioration.

### 7.2.4 Probability of occurrence

Probability describes the likelihood of the impacts occurring. This determination is based on previous experience with similar projects and/or based on professional judgment. **Table 7-4** shows impact rating in terms of probability of occurrence.

**Table 7-4: Probability of occurrence impact rating**

Low (1)	Medium/Low (2)	Medium (3)	Medium/High (4)	High (5)
Improbable; low likelihood; seldom. No known risk or vulnerability to natural or induced hazards.	Likely to occur from time to time. Low risk or vulnerability to natural or induced hazards	A possible, distinct possibility, frequent. Low to medium risk or vulnerability to natural or induced hazards.	Probable if mitigating measures are not implemented. Medium risk of vulnerability to natural or induced hazards.	Definite (regardless of preventative measures), highly likely, and continuous. High risk or vulnerability to natural or induced hazards.

### 7.2.5 Significance

Impact significance is determined through a synthesis of the above impact characteristics. The significance of the impact “without mitigation” is the main determinant of the nature and degree of mitigation required. As stated in the introduction to this section, for this assessment, the significance of the impact without prescribed mitigation actions is measured.

Once the above factors (**Table 7-1**, **Table 7-2**, **Table 7-3**, and **Table 7-4**) have been ranked for each potential impact, the impact significance of each is assessed using the following formula:

$$\text{SIGNIFICANCE POINTS (SP)} = (\text{MAGNITUDE} + \text{DURATION} + \text{SCALE}) \times \text{PROBABILITY}$$

The maximum value per potential impact is 100 significance points (SP). Potential impacts were rated as high, moderate, or low significance, based on the following significance rating scale (**Table 7-5**).

Table 7-5: Significance rating scale

<i>Significance</i>	<i>Environmental Significance Points</i>	<i>Colour Code</i>
High (positive)	>60	H
Medium (positive)	30 to 60	M
Low (positive)	1 to 30	L

<b>Significance</b>	<b>Environmental Significance Points</b>	<b>Colour Code</b>
Neutral	0	N
Low (negative)	-1 to -30	L
Medium (negative)	-30 to -60	M
High (negative)	-60<	H

**Positive (+)** – Beneficial impact

**Negative (-)** – Deleterious/ adverse+ Impact

**Neutral** – Impacts are neither beneficial nor adverse

For an impact with a significance rating of high (-ve), mitigation measures are recommended to reduce the impact to a medium (-ve) or low (-ve) significance rating, provided that the impact with a medium significance rating can be sufficiently controlled with the recommended mitigation measures. To maintain a low or medium significance rating, monitoring is recommended for a period to enable the confirmation of the significance of the impact as low or medium and under control.

The assessment of the exploration phases is done for pre-mitigation and post-mitigation.

The risk/impact assessment is driven by three factors:

**Source:** The cause or source of the contamination.

**Pathway:** The route taken by the source to reach a given receptor

**Receptor:** A person, animal, plant, ecosystem, property, or a controlled water source. If contamination is to cause harm or impact, it must reach a receptor.

A pollutant linkage occurs when a source, pathway, and receptor exist together. Mitigation measures aim firstly, to avoid risk and if the risk cannot be avoided, mitigation measures to minimize the impact are recommended. Once mitigation measures have been applied, the identified risk would reduce to lower significance (Booth, 2011).

This assessment focuses on the three project phases namely, prospecting, exploration (and possible analysis), and decommissioning. The potential negative impacts stemming from the proposed activities of the EPL are described and assessed and mitigation measures are provided thereof. Further mitigation measures in a form of management action plans are provided in the Draft Environmental Management Plan.

### 7.3 Assessment of Potential Negative Impacts

The main potential negative impacts associated with the operation and maintenance phase are identified and assessed below:

#### 7.3.1 Disturbance to the grazing areas

The EPL is an overlying a communal area that has livestock and wildlife. Exploration activities such as site clearing, trenching, and drilling can potentially lead to the disturbance of grazing land. This will potentially affect the grazing land available for livestock and wildlife, and since they greatly depend on the little available flora, their livelihood will be impacted.

The effect of exploration work on the land (when done over a wider spatial extent), if not mitigated, may hinder grazing areas. Under the status quo, the impact can consider being of a medium significance rating. With the implementation of appropriate mitigation measures, the rating will be reduced to a lower significance. The impact is assessed in **Table 7-6** below.

**Table 7-6: Assessment of the impacts of exploration on grazing areas**

Mitigation Status	Extent	Duration	Intensity	Probability	Significance
<b>Pre mitigation</b>	M: -4	M: -3	M: -4	M/H: 5	M: -55
<b>Post mitigation</b>	L/M: -2	L/M: -2	L/M: -4	L/M: 3	L: -24

#### 7.3.2 Land Degradation and Loss of Biodiversity

**Fauna:** The trenching, pitting, and drilling activities carried out during exploration would result in land degradation, leading to habitat loss for a diversity of flora and fauna ranging from

microorganisms to large animals and trees. Endemic species are most at risk since even the slightest disruption in their habitat can result in extinction.

The presence and movement of the exploration workforce and operation of project equipment and heavy vehicles would disturb livestock and wildlife present on farms. The proposed activities may also carry the risk of the potential illegal hunting of local wildlife. This could lead to the reduction of specific faunal species, which may limit tourism (sightseeing and safari) activity in the area.

Additionally, if the exploration sites are not rehabilitated, they could pose a high risk of injuries to animals by falling into holes and pits.

**Flora:** Direct impact of exploration works on flora will mainly occur through clearing for exploration access routes and associated infrastructure. The dust emissions from drilling may also affect surrounding vegetation through the fall of dust, if excessive. Some loss of vegetation is an inevitable consequence of the development. However, given the abundance of shrubs and site-specific areas of exploration on the EPL, the impact will be localized, therefore manageable.

Under the status, the impact can be of a medium significance rating. With the implementation of appropriate mitigation measures, the rating will be reduced to a low significance rating. The impact is assessed in **Table 7-7** below.

**Table 7-7: Assessment of the impacts of exploration on biodiversity**

Mitigation Status	Extent	Duration	Intensity	Probability	Significance
<b>Pre mitigation</b>	M: -4	M: -4	M: -6	M/H: 4	M: -56
<b>Post mitigation</b>	L/M: -3	L/M: -3	L/M: -4	L/M: 3	L: -30

### 7.3.3 Generation of Dust (Air Quality)

Dust emanating from site access routes when transporting exploration equipment and supply to and from the site may compromise the air quality in the area. Vehicular movements from heavy vehicles such as trucks would potentially create dust, even if it is not anticipated to be low. Additionally, activities carried out as part of the exploration works such as drilling would contribute to the dust levels in the air. The medium significance of this impact can be reduced to a low

significance rating by properly implementing mitigation measures. The impact is assessed in **Table 7-8** below.

**Table 7-8: Assessment of the impacts of exploration on air quality**

Mitigation Status	Extent	Duration	Intensity	Probability	Significance
Pre mitigation	M: -3	M: -3	M/L: -4	M/H: 4	M: -40
Post mitigation	L - 2	L - 2	L - 2	L - 1	L - 6

### 7.3.4 Water Resources Use

Water resources are impacted by project developments/activities in two ways - through pollution (water quality) or over-abstraction (water quantity) or at times both.

The abstraction of more water than can be replenished from low groundwater potential areas would negatively affect the local communities (communal and commercial farmers and livestock) that depend on the same low potential groundwater resource (aquifer).

The impact of the project activities on the resources would be dependent on the water volumes required by each project activity. Exploration activities use a lot of water, mainly for drilling. However, this depends on the type of drilling methods employed (diamond drilling is more water-consuming compared to drilling methods such as reverse circulation for instance) and the type of mineral being explored.

The drilling method to be employed for this project's exploration activities is Reverse Circulation. Given the low to medium groundwater potential of some project site areas, the Proponent may consider carting some of the water volumes from outside the area and stored in industry-standard water reservoirs/tanks on site. The exact amounts of water required for proposed operations would be dependent on the duration of the exploration works and the number of exploration boreholes required to make a reliable interpretation of the commodities explored. The exploration period is temporally limited, therefore, the impact will only last for the duration of the exploration activities and ceases upon their completion.

*In the case of considering the abstraction of water from onsite water sources, it is recommended for the Proponent to obtain a permit, if necessary, as required under the Water Act No. 54 of 1956 (enforced), and the Water Resources Management Act, No. 11 of 2013.*

Without the implementation of any mitigation measures, the impact can be rated as medium, but upon effective implementation of the recommended measures, the impact significance would be reduced to low as presented in **Table 7-9** below.

**Table 7-9: Assessment of the project impact on water resource use and availability**

Mitigation Status	Extent	Duration	Intensity	Probability	Significance
Pre mitigation	M - 3	M/H - 3	L/M - 4	M/H - 4	M - 40
Post mitigation	L/M - 1	L/M - 1	L - 2	L/M - 3	L - 12

### 7.3.5 Soil and Water Resources Pollution

The proposed exploration activities are associated with a variety of potential pollution sources (i.e., lubricants, fuel, and wastewater) that may contaminate/pollute soils, and eventually, surface and groundwater. The anticipated potential source of pollution to water resources from the project activities would be hydrocarbons (oil) from project vehicles, machinery, and equipment as well as potential wastewater/effluent from exploration-related activities.

The spills (depending on volumes spilled on the soils) from machinery, vehicles, and equipment could infiltrate into the ground and pollute the fractured or faulted aquifers on site, and with time reach further groundwater systems in the area. However, it should be noted that the scale and extent/footprint of the activities where potential sources of pollution will be handled is relatively small. Therefore, the impact will be moderately low.

Pre-implementation of any mitigation measures, the impact significance is medium to high and upon implementation, the significance will be reduced to moderate. The impact is assessed in **Table 7-10** below.

It is notable that during the operational phase of the project, soil sampling is conducted. *Therefore, the Soil Conservation Act (No 76 of 1969) should be taken into account to ensure that soils are conserved in a way that does not promote soil erosion.* (Refer to the EMP).

**Table 7-10: Assessment of the project impact on soils and water resources (pollution)**

Mitigation Status	Extent	Duration	Intensity	Probability	Significance

<b>Pre mitigation</b>	M - 5	M/L - 3	M/L - 3	M - 4	M - 44
<b>Post mitigation</b>	L - 3	M - 3	L - 3	L/M - 3	L - 27

### 7.3.6 Waste Generation

During the prospecting and exploration program, domestic and general waste is produced on-site. If the generated waste is not disposed of responsibly, land pollution may occur on the EPL or around the sites. The EPL is in an area of moderate sensitivity to pollution. Improper handling, storage, and disposal of hydrocarbon products and hazardous materials at the site may lead to soil and groundwater contamination, in case of spills and leakages. Therefore, the exploration program needs to have appropriate waste management for the site. To prevent these issues, any hazardous waste that may have an impact on animals, vegetation, water resources, and the general environment should be handled cautiously. Without any mitigation measures, the general impact of waste generation has a medium significance. The impact will reduce to low significance, upon implementing the mitigation measures. The assessment of this impact is given in **table 7-11** below.

**Table 7-11: Assessment of waste generation impact**

Mitigation Status	Extent	Duration	Intensity	Probability	Significance
<b>Pre mitigation</b>	L/M - 2	L/M - 2	M - 6	M - 5	M - 50
<b>Post mitigation</b>	L - 1	L - 1	L - 2	L/M - 2	L - 8

### 7.3.7 Occupational Health and Safety Risks

Project personnel (workers) involved in the exploration activities may be exposed to health and safety risks. These may result from accidental injury, owing to either minor (i.e., superficial physical injury) or major (i.e., involving heavy machinery or vehicles) accidents. The site safety of all personnel is the Proponent's responsibility and should be adhered to as per the requirements

of the Labour Act (No. 11 of 2007) and the Public Health Act (No. 36 of 1919). The heavy vehicle, equipment, and fuel storage area should be properly secured to prevent any harm or injury to the project workers or local animals.

The use of heavy equipment, especially during drilling, and the presence of hydrocarbons on sites may result in accidental fire outbreaks, which could pose a safety risk to the project personnel, equipment, and vehicles. It may also lead to widespread veld fires if an outbreak is not contained and if machinery and equipment are not properly stored, the safety risk may be a concern for project workers and residents.

The impact is probable and has a medium significance rating. However, with adequate mitigation measures, the impact rating will be reduced to low. This impact is assessed in **Table 7-12** below and mitigation measures are provided.

**Table 7-12: Assessment of the impacts of exploration on health and safety**

Mitigation Status	Extent	Duration	Intensity	Probability	Significance
Pre mitigation	M - 3	M/L - 2	M - 6	M/H - 4	M - 44
Post mitigation	L/M - 2	L/M - 2	L - 2	L/M - 2	L - 12

### 7.3.8 Vehicular Traffic Use and Safety

The EPL is accessible via the C43 road from Okangwati, which connects to D3701 and D3702 leading to the EPL area. These are some of the main transportation routes for all vehicular movement in the area and provide access to the EPL and connect the project area to other towns. Traffic volume will therefore increase on these district roads during exploration as the project would need delivery of supplies and services on site.

Depending on the project needs, trucks, medium-sized vehicles, and small vehicles will frequent the area to and from exploration sites on the EPL. This would potentially increase slow-moving heavy vehicular traffic along these roads and add additional pressure on the roads. However, transportation of materials and equipment is expected to occur on a limited schedule and only for the duration of the project. Therefore, the risk is anticipated to be short-term, not frequent, and

therefore of medium significance. Before mitigation, the impact can be rated medium and with the implementation of mitigation measures, the significance will be low as assessed in **Table 7-13** below.

**Table 7-13: Assessment of the impacts of exploration on-road use (vehicular traffic)**

Mitigation Status	Extent	Duration	Intensity	Probability	Significance
Pre mitigation	M - 4	M/H - 3	L/M - 4	M/H - 5	M - 55
Post mitigation	L/M - 2	L/M - 2	L - 2	L/M - 2	L - 12

### 7.3.9 Noise and vibrations

Prospecting and exploration work (especially drilling) may be a nuisance to surrounding communities due to the noise produced by the activity. Excess noise and vibrations can be a health risk to workers on site. The exploration equipment used for drilling on site is of medium size and the noise level is bound to be limited to the site only, therefore, the impact likelihood is minimal. Without any mitigation, the impact is rated as of medium significance. To change the impact significance from the pre-mitigation significance to a low rating, mitigation measures should be implemented. This impact is assessed in **Table 7-14** below.

**Table 7-14: Assessment of the impacts of noise and vibrations from exploration**

Mitigation Status	Extent	Duration	Intensity	Probability	Significance
Pre mitigation	L/M - 2	L/M - 2	M - 6	M/H - 3	M - 30
Post mitigation	L - 1	L/M - 2	L - 2	L/M - 2	L - 10

### 7.3.10 Disturbance to Archaeological and Heritage Resources

The specialist archaeological assessment conducted indicates that Kunene Region is sensitive and contains many archeological/cultural significant sites, and there is a possibility of unveiling/discovering new archeological and/or cultural materials in the proposed project area. If such Materials are found the areas must be mapped out and coordinates taken to establish “No-

Go-Areas”, due to their sensitivity and then documented. They may be protected either by fencing them off or demarcation for preservation purposes, or excluding them from any development i.e., no exploration activities should be conducted near these recorded areas through the establishment of buffer zones.

This impact can be rated as medium significance if there are no mitigation measures in place. Upon implementation of the necessary measures, the impact significance will be reduced to a lower rating. The impact is assessed in **Table 7-15**.

**Table 7-15: Assessment of the impacts of exploration on archaeological & heritage resources**

Mitigation Status	Extent	Duration	Intensity	Probability	Significance
<b>Pre mitigation</b>	M - 3	M/H - 4	M - 6	M/H - 4	M – 52
<b>Post mitigation</b>	L/M - 2	L/M - 2	L - 2	L/M - 2	L - 12

### 7.3.11 Impact on Local Roads/Routes

Exploration projects are usually associated with the movements of heavy trucks and equipment or machinery that use local roads. Heavy vehicles traveling on local roads exert pressure on the roads and may make the roads difficult to use. This will be a concern if maintenance and care are not taken during the exploration phase. The impact would be short-term (during exploration only) and therefore, manageable.

Without any management and or mitigation measures, the impact can be rated as medium and to reduce this rating to low, the measures will need to be effectively implemented. The assessment of this impact is presented in **Table 7-16**.

**Table 7-16: Assessment of exploration of local services (roads and water)**

Mitigation Status	Extent	Duration	Intensity	Probability	Significance
<b>Pre mitigation</b>	M/H - 4	M - 3	M - 6	M - 3	M – 39
<b>Post mitigation</b>	L - 1	L - 1	M/L - 4	M/L -2	L - 12

### 7.3.12 Social Nuisance: Local Property Intrusion and Disturbance/Damage

The presence of some non-resident workers may lead to social annoyance to the local community. This could particularly be a concern if they enter or damage local private property. The private properties of the locals may include houses, fences, vegetation, livestock, wildlife, or any properties of economic or cultural value to the farm/land owners or land users. The damage or disturbance to properties may not only be private but local public properties. The unpermitted and unauthorized entry to private property may cause clashes between the affected property (land) owners and the Proponent.

The impact is rated as of medium significance. However, upon mitigation (post-mitigation), the significance will change from a medium to a low rating. The impact is assessed below in **Table 7-17**.

**Table 7-17: Assessment of the social impact of community property damage or disturbance**

Mitigation Status	Extent	Duration	Intensity	Probability	Significance
Pre mitigation	M - 2	M - 3	M - 4	M/H - 3	M - 27
Post mitigation	L - 1	L - 1	M/L - 4	M/L - 2	L - 12

## 7.4 Cumulative Impacts Associated with Proposed Exploration

According to the International Finance Corporation (2013), cumulative impacts are defined as “impacts that result from the successive, incremental, and/or combined effects of an action, project, or activity (collectively referred to in this document as “developments”) when added to other existing, planned, and/or reasonably anticipated future impacts”.

Like many other exploration projects, some cumulative impacts to which the proposed project and associated activities potentially contribute, are the:

- **Impact on road infrastructure:** The proposed exploration activity contributes cumulatively to various activities such as farming activities and traveling associated with tourism and local daily routines. The contribution of the proposed project to this cumulative impact is however not considered significant, given the short duration, and spatial extent of the intended mineral exploration activities.

Excel Dynamic Solutions (Pty) Ltd

- **Use of water:** While the contribution of this project will not be significant, mitigation measures to reduce water consumption during exploration are essential.

## 8 RECOMMENDATIONS AND CONCLUSION

### 8.1 Recommendations

The potential positive and negative impacts of the proposed exploration activities on EPL 8685 were identified and assessed and appropriate management and mitigation measures (to negative impacts) were made thereof for implementation by the Proponent, their contractors, and project-related employees.

Mitigation measures for identified issues have been provided in the Environmental Management Plan, for the Proponent to avoid and/or minimize their significant impacts on the environmental and social components. Most of the potential impacts were found to be of medium-rating significance. With effective implementation of the recommended management and mitigation measures, a reduced rating in the significance of adverse impacts is expected from Medium to Low. To maintain the desirable rating, the implementation of management and mitigation measures should be monitored by the Proponent directly, or their Environmental Control Officer (ECO). The monitoring of implementation will not only be done to maintain a low rating but also to ensure that all potential impacts identified in this study and other impacts that might arise during implementation are properly identified in time and addressed right away.

The Environmental Consultant is confident that the potential negative impacts associated with the proposed project activities can be managed and mitigated by the effective implementation of the recommended management and mitigation measures and with more effort and commitment put into monitoring the implementation of these measures.

It is, therefore, recommended that in the case of granting an ECC for this project, the proposed prospecting and exploration activities may be granted an ECC, provided that:

- All the management and mitigation measures provided in the EMP are effectively and progressively implemented.

Excel Dynamic Solutions (Pty) Ltd

- All required permits, licenses, and approvals for the proposed activities should be obtained as required. These include permits and licenses for land use access agreements to explore and ensure compliance with these specific legal requirements.
- The Proponent and all project workers and contractors must comply with the legal requirements governing the project and ensure that all required permits and or approvals are obtained and renewed as stipulated by the issuing authorities.
- Site areas where exploration activities have ceased are rehabilitated, as far as practicable, to their pre-exploration state.

## **8.2 Conclusion**

It is crucial for the proponents and their contractors to effectively implement the recommended management and mitigation measures, to protect the biophysical and social environment throughout the project duration. This would be done to promote environmental sustainability while ensuring a smooth and harmonious existence and purpose of the project activities in the community and environment at large. It is also to ensure that all potential impacts identified in this study and other impacts that might arise during implementation are properly identified in time and addressed accordingly. Lastly, should the ECC be issued, the Proponent will be expected to be compliant with the ECC conditions as well as legal requirements governing mineral exploration and related activities.
