i. Purpose of This Environmental Impact Assessment Report

This Environmental Scoping Report (ESR) follows the Scope of Work delineated by POWERCOM Pty Ltd. Existing information and input from commenting authorities, Interested and Affected Parties (I&APs) was used to identify and evaluate potential environmental impacts (both social and biophysical) associated with the proposed project.

Environmental flaws associated with the proposed project were identified through the ESR. A conscious decision was made based on the recommendations and guidelines of the Directorate of Environmental Affairs EIA guidelines to assess both significant and less significant environmental impacts proposed by the development. The developed Environmental Management Plan (EMP) for this proposed activity will have to be effectively implemented by the client, to ensure that adverse environmental impacts are not considered.

A detailed assessment of the anticipated impacts was undertaken to highlight any areas of concern regarding the proposed project during its construction, and operation. In addition, an independent sensitivity mapping analysis was undertaken. This analysis characterised the development site on the significant environmental aspects to reflect the site's suitable and unsuitable (no-go) development footprint areas. This action guided the final footprint of the PV Plant and the transmission line.

This report will also be used to motivate and define the previously identified project alternatives (i.e. site, technology, and layout) based on the findings of the environmental baseline study and the suitability of the site to the type of development. This EIAR has been compiled in accordance with the regulatory requirements stipulated in the EIA Regulations (2012), promulgated in terms of the Namibian environmental legislation (Environmental Management Act (No. 7 of 2007))

The ESR aims to:

- Provide an overall assessment of the social, physical, and biophysical environments of the area affected by the proposed establishment of the base transceiver station tower (BTS);
- Undertake a detailed environmental assessment, in terms of environmental criteria and impacts (direct, indirect, and cumulative), and recommend a preferred location for the proposed plant (based on environmental sensitivity);

- Identify and recommend appropriate mitigation measures for potentially significant environmental impacts; and
- Undertake a fully inclusive Public Participation Process (PPP)
- GIS sensitivity mapping was conducted to identify potential impacts, propose mitigation and inform the sensitivity analysis.

ii. Assumptions And Limitations

The following assumptions and limitations underpin the approach to this EIA study:

- The information received from the stakeholders, desktop surveys, and baseline assessments are current and valid at the time of the study;
- A precautionary approach was adopted in instances where baseline information was insufficient or unavailable;
- Mandatory timeframes will apply to the review and adjudication of the reports by the competent authority and other government departments; and
- No land claims have been registered for the proposed site at the onset and registration of the study.

NB: The EAP does not accept any responsibility in the event that additional information comes to light at a later stage of the process. All data from unpublished research utilised for the purposed of this project is valid and accurate. The scope of this investigation is limited to assessing the potential biophysical, social and cultural impacts associated with the proposed project.

1. CHAPTER ONE: BACKGROUND

1.1. Introduction

POWERCOM (PTY) LTD herein referred to as the proponent has identified different areas that need improved communication alternatives in Namibia due to the growth in population and economic activities. To achieve the objective of improved telecommunication connectivity, POWERCOM has been appointed by Telecom Namibia, its sister company to establish telecommunication towers across different locations countrywide and Howobees is one of the areas identified. The development is earmarked to expand connectivity, decongest connectivity and promote ICT in rural and peri-urban environments.

However, the telecommunication towers cannot be constructed without prior consent from interested and affected parties as well as obtaining an Environmental Clearance Certificate for development. In this respect, D&P Engineers and Environmental Consultants cc has been appointed as an Environmental Assessment consultant to carry out an Environmental and Social Impact Assessment study to obtain an environmental clearance certificate as per the requirements of the Environmental Management Act No. 7 of 2007 and Namibian Environmental Impact Assessment Regulations of 2012 in terms of telecommunication infrastructure.

1.2. Project Location

The proposed tower is to be erected at Howobees 51, Karas region. The site coordinates are indicated as follows:

- Latitude: 26°46'48.8"S
- Longitude: 18°33'19.5"E.

The site is located about +/- 3km from the B1 road and 0.487 km from the D1 gravel road. The site is in a settlement area, the Howobees 51, and the area is surrounded by other farms that mostly deal with cattle farming and a little crop farming.

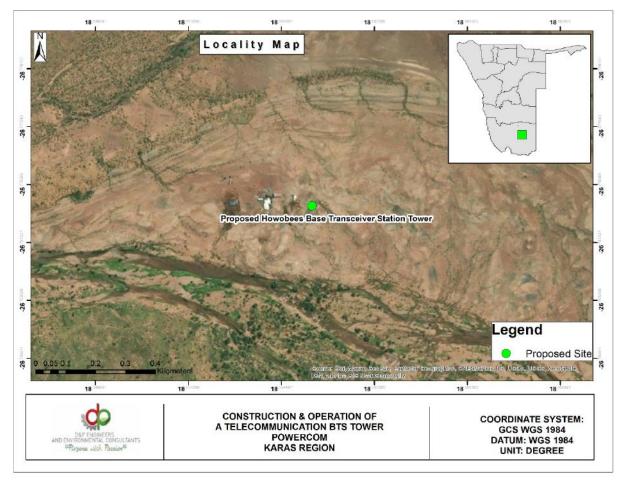

Figure 1: Site Locality

1.3. Project Overview

TELECOM Namibia's information and technology infrastructure development subsidiary, POWERCOM (Pty) Ltd is on a drive of construction network towers across the country. POWERCOM targets that, other than improving internet and voice connectivity in the regions, there is also a need to increase the company's footprint and asset base to best service ICT stakeholders and offer better connectivity in all regions of the country. POWERCOM aims at providing different telecommunication service providers in Namibia with ready-to-use infrastructure as well as expanding network coverage into the different areas where there is weak or no network connectivity at all.

Behind this backdrop, Telecom identified areas that need improved network connectivity that is currently not serviced with telecom network. The applicant, POWERCOM Pty Ltd, therefore intends to develop 22 telecommunication towers countrywide and Howobees is one of the planned sites.

The Howobees BTS development will include the following:

- The project entails the construction of a 30m lattice tower with a footprint size of a 20m x 20m area and a support container;
- The site is to accommodate TN Mobile service and other service providers.
- The structure will be fenced to limit public access to it and it will be electrified to prevent baboons from entering.
- The base station will be a secured building and sufficient precautions will be made to prevent access to the antenna support structure.
- Access to the area will be strictly controlled through a locked gate as illustrated below;

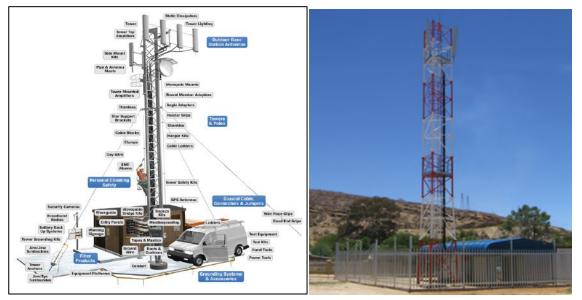

Figure 2: Typical telecommunication towers structure and form (visual puproposes only)

1.3.1. Accessibility

The site is easily accessible from the Howobees access road.

1.3.2. Infrastructure and Services

- **Water:** Water for construction will be obtained from the existing water infrastructure, (borehole).
- Ablution: Construction ablutions will be temporary toilets.
- **Electricity:** There is an existing electricity connection on site but it's solar which is used by the landowner.
- **Communication:** The proposed project will provide for communication in the area.

Figure 3: Solar Plant on Howobees 51

1.4. The project Environs

The project site is on a hilltop, which is 334.98m, north of the Lowen River which feeds the Naute Dam. The area is characterised by grass and bushes such as Euphobia. The proposed site is close to the land owner's farmhouse which has a cattle kraal, storeroom, workshop, greenhouse, borehole (solar) and a greenhouse. The Area is used for livestock farming and consists of small-crop farming activity.

1.5. Need and Desirability

The economic and social development goals of Namibia are embodied in (i) Vision 2030 and (ii) the National Development Plan 5 (NDP 5) 2017/2018 – 2021/2022 as well as NDPs 1, 2, 3, and 4. In addition, the Government has developed the Harambee Prosperity Plan (HPP) 2016/2017 – 2019/2020, which complements Vision 2030 and NDP 5. All of the three plans set the goals, targets, and strategy for Namibia to move on a path to economic prosperity through a concerted strategy for the development of Namibia's economic growth. These Plans also include specific growth targets, milestones, and strategies for the sustainable deployment of Namibia's resources to achieve the stated economic and social development goals. Communication is one of the major targets aimed in the NDP5 and to stimulate the development of any aspect, internet and voice connectivity is a prerequisite.

This project is a major step in addressing the objectives of the developmental plans and targets of the Namibian government and the development will ensure that there is connectivity for the Howobees community who will need to keep connected to their business and family.

1.6. Project Alternatives

1.6.1. Site Location Alternatives

An integrated site selection study was done to identify a suitable site for the proposed tower. The proposed site is considered highly desirable due to the following considerations:

- Elevation: The project location is strategic because it can allow the covering of a wider radius within the game reserve.
- Land suitability: The site is easily accessible by road and near an electrical connection to power the tower components.

It is thus, the consideration of the above criteria resulted in the selection of the preferred site. No further site location alternatives are considered in the EIA process.

1.6.2. Tower Infrastructure Alternatives

There are several types of telecommunication towers design and forms. In this respect, to cater for a 20-40m height to make sure network connectivity in Howobees is good and does not overshoot, the proponent will invest in a Lattice tower.

1.6.3. Conclusion

Based on the preceding alternative analysis and options, the project will go ahead and will ensure maximum environmental and safety performance systems are in place

2. CHAPTER TWO: POLICY, LEGAL AND ADMINISTRATIVE FRAMEWORK

2.1. Introduction

An important part of the EIA is identifying and reviewing the administrative, policy, and legislative frameworks concerning the proposed activity, to inform the proponent about the requirements to be fulfilled in undertaking the proposed project. This section looks at the legislative framework within which the proposed development will conform; the focus is on compliance with the legislation during the planning, construction, and operational phases. All relevant legislations, policies, and international statutes applying to the project are highlighted in the table below as specified in the Environmental Management Act, 2007 (Act No.7 of 2007) and the regulations for Environmental Impact Assessment as set out in the Schedule of Government Notice No. 30 (2012).

3. CHAPTER THREE: RECEIVING ENVIRONMENT

3.1. Introduction

In this chapter, the findings of the EIA Team on baseline surveys, public consultation, and desk reviews are undertaken with respect to the ecology, society, economy, and geo-political setup of the proposed project area. The geological makeup and meteorology of the project site will also be discussed in this chapter to give an in-depth understanding of the project area in question.

3.1.1. Socio-Economic status

Howobees 51 is a farm about 50 kilometres (16 mi) southeast of Keetmanshoop. Land use in this area consists of farms that focus on livestock farming of goats, sheep and, cattle and, some farms are doing a bit of crop farming, the land is also used for tourism.

Due to the far distribution of farms, and little vegetation on the site, the construction impacts will be minimum if mitigated by the Environmental Management Plan. The tower will improve network connection for businesses in the areas and, tourists or Howobees residents will have internet access to communicate with family and friends.

Figure 4: Existing Land use: Private landowner residents (Howobees 51 homestead)

Figure 5: Existing land use: livestock, greenhouse and workshop

Figure 6: Existing Land use: Greenhouse

3.2. Climate

Karas is known for its extreme weather since it has a subtropical desert climate. It is located at an elevation of 947.1 meters above sea level which have a yearly temperature of 24.34°C and it is - 0.12% lower than Namibia's averages. Karas typically receives about 18.12 millimeters of precipitation and has 34.64 rainy days (9.49% of the time) annually. Therefore, in Karas, the summers are long and hot, the winters are short, cool, and windy, and it is dry and mostly clear year round.

3.3. Fauna

Fauna varies depending on the type of vegetation, climate, and topography of an area. The Karas region hosts a variety of large to small games, ranging from Kudu and Springbok to Duiker, Klipspringer, Steenbok, Jackal, and Caracal. The Kudu are abundant among the 'koppies' and roam free, leaping over any fence that may come in their way, whereas the Springbok on the other hand

are bound to single encampments because they lack the suppleness and length to jump over fences. Caracals are widely hunted down by farmers because they prey on the lambs of sheep. Gemsbucks are also widely scattered across the region in addition to Zebra and Red Hartebeest. However, all of these species were not observed on the specific site due to human presence and the openness of the vegetation. Besides, the reduction or loss of grazing area for animals, hence the project will have minimal impacts on fauna.

3.4. Avifauna

The karas area consists mostly of grass-shrubland but you can find trees such as Acacia growing along a water channel or river which play or mostly constitute a suitable area for bird habitation. The type of birds most likely to be found or observed in this area, especially in the lower river is Little Swift, Dusky Sunbird, Speckled Pigeon, Acacia Pied Barbet, Cape Sparrow and many others.

It is imperative to understand that the specific site consists of grasses and scattered shrubs. But there are acacia trees along the Lowen river possibly consisting of bird nests. Therefore no contact will occur with the avifauna; hence the project will have minimal or no impacts on the birds and their habitats.

3.5. Flora

Rainfall in Karas is usually both low and extremely variable which means that years of abundant rain are often followed by extremely dry conditions. As a result of low rainfall, vegetation is generally sparse, with few trees and a thin covering of grass. Plant cover varies with rainfall. The Aloe dichotoma or Quiver Tree (Namibia's national tree) is mostly found in Karas. Other plants include the three thorns Rhigozum (Rhigozum trichotomum), various grass species, and species of succulents, such as the Euphorbia However, most of these species are not present on the site. The area consists dominantly of grass species, with scattered shrubs such as Euphobia Gregaria, which is the dominant shrub.

The removal of any vegetation especially in the surrounding area should still be done in a properly managed, planned and responsible manner to avoid the destruction of unnecessary ground cover. The rehabilitation of disturbed areas is important and should be done following the Environmental Management Plan (EMP) hence the project will have minimal impacts on the environment

Figure 7: Overview of vegetation on site

Figure 8: Euphobia Gregaria

3.6. Hydrology

The project area is 334.98m north of the Lowen River which feeds the Naute Dam. The Lowen River is at a much lower altitude than the tower site. During the construction phase, it is important to ensure that pollution prevention to prevent runoff pollutants to be washed into the water channel is strictly implemented. Construction is also recommended not to be conducted during the rainy season. The proposed project will have little or no significant impact on general area hydrological drainage, and thus, the project will have a relatively low impact on surface water hydrology.

Figure 9: Lowen River

3.7. Pedology & Geology

Howobees is situated within the Nama-Karoo Basin, which is a "large, flat-lying plateau which dominates much of southern Namibia. Sedimentary rocks deposited in the Nama Basin and later in the same area in the Karoo Basin form the foundations of the landscape. The basin slopes from the north, where elevations are about 1,400 m above sea level, to the south, where altitudes are approximately 900 m above sea level. The Fish, Löwen, and Konkiep rivers drain the landscape, all flowing south to the Orange River" (Mendelsohn, 2002). There is no to little vegetation cover in the area because the soil will not be able to provide plants with sufficient water or nutrients. The potential soil impact in the study area is that the soils in the area are susceptible to erosion and compaction, therefore the disturbance of the soil surface in the vicinity of the project must be minimised to prevent wind erosion. The footprint of the construction area must be kept as small as possible and existing access roads are to be utilised at all times to avoid off-road tracks. The project footprint area should not be cleared entirely and the site should be rehabilitated after the construction phase.

Figure 10: Soil type on site

3.8. Topography

The project site is on a hilltop. However, the project site area is 334.98m north of the Lowen River. Therefore, pollution prevention and stormwater control should be implemented.

3.9. Archaeology and Heritage

There are no declared heritage sites by the National Heritage Council of Namibia at Howobees 51, Karas Region, however, an accidental find procedure at the subject area may be required.

3.10. Alien Plant Assessment

The alien plants were considered during the botanical assessment. It was found that no alien plant species were found on site.

4. CHAPTER FOUR: PUBLIC CONSULTATION

Public and Stakeholder involvement is a key component of the EA process. The public consultation process, as set out in Section 21 of Regulation No 30 of EMA, has been followed during this assessment, and the details thereof are documented below.

4.1. Printed Media

4.1.1. Background Information Document

A Background Information Document (BID) was drafted at the onset of the EA process to act as a useful information handout about the proposed project development. In addition, the BID provided details on the public consultation process with contact details for further information. This document was advertised for availability through various means of newspaper articles, Public meetings, and electronic mail; see Appendix B of this document

4.1.2. Newspaper Advertisements & Articles

Newspaper notices about the proposed project and related Environmental Assessment processes were circulated in two newspapers for two weeks. These notices appeared in the "Confidante" and "New Era" newspapers, shown in Appendix B.

4.1.3. Site Notices

A site notice was placed at the project site, Howobees entrance, and route to Howobees. These provided information about the project and related EA while providing contact details of the project team.

Figure 11: Site Notice

4.1.4. Building a Stakeholder Database

A stakeholder database for the project was collected through a variety of means. During the advertisement of the project (through public notices in local newspapers and site notices) the list

was augmented as Interested & Affected Parties (I&AP) registered and the contact information of stakeholders was updated, Please refer to Appendix B.

4.1.5. Stakeholder Meetings & Key Conversations

A public meeting was scheduled on Wednesday, 14 September 2022 at Howobees, and the meeting was well attended by all stakeholders. Appendix b has a detailed list of the attendance register. The consultant administered questionnaires during the meeting to all members who attended the meeting.

Figure 12: Community engagement meeting conducted

4.1.6. Comments and review period

From the onset of the public consultation process and the initial information sharing through the BID, newspaper, and site notices, various stakeholders have registered and provided comments. All of the immediate neighbours are in support of the initiative. The Scoping Report and Environmental Management Plan were made available to the public and stakeholders for comment and review. Questionnaires and proof of stakeholder engagement are attached in appendix B of this EAR.

5. CHAPTER FIVE: ENVIRONMENTAL AND SOCIO-ECONOMIC IMPACTS

5.1. Overview

POWERCOM has committed to sustainability and environmental compliance by coming up with a corrective action plan for all anticipated environmental impacts associated with the project. This is also in line with the Namibian Environmental Management legislation and International best practices on telecommunication infrastructure. The proponent will implement an Environmental Management Plan (EMP) in order to prevent, minimize and mitigate negative impacts. The environmental management plan is being developed to address all the identified expected impacts, the plan will be monitored and updated continuously with the aim of continuous improvement to address impacts.

5.2. Assessment Of Impacts

This section sets out the overall approach that was adopted to assess the potential environmental and social impacts associated with the project. To fully understand the significance of each of the potential impacts each impact must be evaluated and assessed. The definitions and explanations for each criterion are set out below in Table 2: Assessment Criteria and

Duration – What is the length of the negative impact?		
None	No Effect	
Short	Less than one year	
Moderate	One to ten years	
Permanent	Irreversible	
Magnitude – What is the effe	ct on the resource within the study area?	
None	No Effect	
Small	Affecting less than 1% of the resource	
Moderate	Affecting 1-10% of the resource	
Great	Affecting greater than 10% of the resource	
Spatial Extent – what is the s	scale of the impact in terms of area, considering cumulative impacts	
and international importance?		
Local	In the immediate area of the impact	
Regional / National	Having large scale impacts	
International	Having international importance	
Type – What is the impact		
Direct	Caused by the project and occur simultaneously with project activities	
Indirect	Associated with the project and may occur at a later time or wider area	

Table 2: Impacts Assessment Criteria

Duration – What is the length of the negative impact?		
Cumulative	Combined effects of the project with other existing / planned activities	
Probability		
Low	<25%	
Medium	25-75%	
High	>75%	

⁽Adopted from ECC-Namiba, 2017)

Table 3: Impacts Significance

Class	Significance	Descriptions
1	Major Impact	Impacts are expected to be permanent and non- reversible on
		a national scale and/or have international significance or
		result in a legislative non- compliance.
2	Moderate Impact	Impacts are long term, but reversible and/or have regional
		significance.
3	Minor	Impacts are considered short term, reversible and/or localized
		in extent.
4	Insignificant	No impact is expected.
5	Unknown	There are insufficient data on which to assess significance.
6	Positive	Impacts are beneficial

(Adopted from ECC-Namiba, 2017)

Table 4: Environmental Impacts and Aspects Assessment

Environmental Impact	Valued Ecosystem	Impact	Project Phase	Duration	Magnitude	Extent	Туре	Probability	Significance	Infrastructure/ Activity
TOPOGRAPHY	Component Landscape	Visual aesthetic impact	Construction	Moderate	Moderate	Local	Direct	Medium 25 - 75%	Minor	Tower
	Scenery		and Operation							construction
SOIL	Soil	Contamination to soil from paints and other potentially hazardous substances	Construction and Operations	Moderate	Small	Local	Direct	Low <25%	Minor	Tower
	Soil	Spillages of fuel, oil and lubricants.	Construction	Short	Small	Local	Direct	Low <25%	Minor	Tower and Access Road construction
	Soil	Erosion	Construction	Moderate	Small	Local	Direct	Low <25%	Minor	Tower and Access Road construction
LAND CAPABILITY	Terrestrial ecology	Change in land use	Construction and Operations	Permanent	Great	Local	Direct	Low <25%	Moderate	Tower
	Carrying capacity	Increase in human activities in the environment	Construction and Operations	Moderate	Moderate	Regional	Direct	Low <25%	Minor	Tower
WATER	Surface water quality	Water pollution from oils, lubricants and chemicals spillages.	Construction and Operations	Moderate	Small	Local	Direct	Medium 25 - 75%	Moderate	Construction hydrocarbons
	Surface water quality	Turbidity and high sediment load	Construction	Moderate	Small	Local	Direct	Low <25%	Moderate	Construction hydrocarbons
AIR QUALITY	Air Quality	Construction phase dust	Construction	Short	Small	Local	Direct	Low <25%	Minor	Tower and Access Road construction
WASTE	Groundwater quality	Hazardous waste such as waste lubricants and stored chemicals may be release into the environment.	Construction and Operations	Short	Small	Local	Direct	Low <25%	Minor	Tower and Access Road construction
	Surface water quality	Threatened from chemicals being washed into nearby rivers	Construction and operations	Moderate	Moderate	Regional	Direct	Medium 25 - 75%	Moderate	Tower and Access Road construction
	Surface water quality	Construction and Operational solid waste	Construction and operations	Moderate	Moderate	Regional	Direct	Medium 25 - 75%	Moderate	Tower and Access Road construction and maintenance

Environmental	Valued	Impact	Project Phase	Duration	Magnitude	Extent	Туре	Probability	Significance	Infrastructure/
