executive summary

Project Overview

InterContinental Mining (Pty) Ltd (herein referred to as the proponent), is partnership company between a Namibian (20 %) and Chinese (80%) nationals and fully registered in Namibia, that ventures in exploration and mining. The company aims at prospecting and eventually developing mining ventures in respect to Base and Rare Metals, Non-Nuclear Fuel, Nuclear Fuel, Precious / Semi-Precious Stone and Precious Metals.

Hence InterContinental Mining has thus applied to obtain a Mining Claims (MCs 69966 & 69967) with a particular focus on exploring and potentially mining for Lithium. To enhance potential impact mitigation, the proponent has an area (537 m²), which encompasses the proposed mining claims.

The Mining Claims (69966 & 69967) are situated in Western Namibia, within the Dorob National Park in the Erongo Region and approximately 23 km East of Cape Cross. The area is accessible directly via the C34 road, connecting Henties Bay to Cape Cross and then by strictly controlled park tracks. Other section of the claim will only be accessed by foot to ensure minimum impacts on the receiving environment.

Their objective is to undertake exploration activities in order to obtain data on the presence of minerals for further mining development. While the proposed activity may stimulate future economic growth and possible rural development, and employment opportunities, it also present possibility of unprecedented negative environmental impacts.

Potential impacts may vary in terms of scale (locality), magnitude and duration e.g. minor negative impacts in the form of dust and noise pollution especially during the handling (loading and off-loading) will be experienced.

Need for the Project

Mining contributes about 25% to the Namibian GDP income, and thus the largest contributor to the Namibian economy. As in many African countries, mining is a key source of mineral commodities essential for maintaining and improving standards of living. Most important, the Namibian government makes provision for its citizens to obtain various mining license in order to create self-employment or business opportunities.

InterContinental Mining (Pty) Ltd, is therefore presented an opportunity to venture into the sector by undertaking an exploration programme in respect in respect to Base and Rare Metals, Non-Nuclear Fuel, Nuclear Fuel, Precious / Semi-Precious Stone and Precious Metals.

Overall, the exploration activities is expected to generate full time medium to long term direct employment for at least 5-10 workers. The majority of workers to be employed on the proposed exploration project are expected to be skilled and/or semi-skilled (general labourers and operators).

Critically, going ahead with the proposed activity creates potential for the following marginal net benefits:

- Contribution Taxes and Royalty
- Technological Skill and Knowledge transfer
- Creates the most needed employment opportunities

Project Description

InterContinental Mining (Pty) Ltd seek to undertake it business / operations on the Mining Claims 71556 -71558 in the Erongo Region. Principally, the joint-venture intends to explore for Lithium (desktop geological study, collection of samples and identification of previous activity in the area where previous mining activities were conducted) by use of hand-held equipment and to small degree sampling, and develop the claims into mining license should they discover viable ore deposit.

The proposed exploration activities mainly consist of the following prospecting activities: Geological mapping: this mainly entails a desktop review of geological area maps and ground observations.

- <u>Lithology geochemical surveys</u>: rock samples shall be collected and taken for trace element analysis. Also, trenches or pits may be dug (in a controlled environment e.g. fencing off and labelling activity sites) adopting manual or excavator to investigate the mineral potential. At all times, the landowner and other relevant stakeholder will be engaged to obtain authorization where necessary.
- <u>Geophysical surveys</u>: entails data collection of the substrata, by air or ground, through sensors such as radar, magnetic and electromagnetic to detect any mineralization in the area.
- <u>Bulk Sampling</u>: Should analyses by an analytical laboratory be positive, holes are
 drilled and drill samples collected for further analysis. This will determine the depth
 of the potential mineralization. If necessary new access tracks to the drill sites will
 be created and drill pads will be cleared in which to set the rig. However, at this
 stage the proponent does not intent to conduct any sampling activities.

Need for an Environmental Impact Assessment

While increased economic activities can stimulate demographic changes and alter social, economic and environmental practices in many ways. Adverse environmental and socio-economic impacts have become a major area of concern for the business community, their customers, and other key stakeholders. As a result, companies seek to manage these impacts as part of their ethical and sustainable business conduct. Similarly, identifying, avoiding, mitigating and managing impacts, is a necessary condition for InterContinental Mining (Pty) Ltd to undertake its operation in compliance with the environmental legislative requirements in Namibia.

To ensure that development activities are undertaken in an economic, social and environmental sound / sustainable manner, the Namibian Constitution and Environmental Management Act No. 7 of 2007 provides for an environmental assessment process. The purpose of the environmental assessment and therefore this report are to ensure compliance of the proposed operations with the environmental legislation in respect to managing potential impacts associated with InterContinental Mining (Pty) Ltd.'s mineral prospecting activities by:

- Identifying potential socio-economic and environmental impacts
- Proposing management measures to avoid, prevent and of mitigate these
- Compile an Environmental Management for compliance monitoring and reporting on the implementation of the Environmental Clearance Certificate conditions

Therefore, InterContinental Mining (Pty) Ltd appointed Enviro-Leap Consulting cc to conduct an environmental assessment and facilitate the process of obtaining and Environmental Clearance Certificate.

Approach to the EIA Process

The assessment process consisted of a site visit to the project location and public consultation meetings with the Interested and Affected Parties (I&APs). An environmental scoping and management plan (EMP) were compiled and constitute the application for an Environmental Clearance Certificate submitted to the Ministry of Environment and Tourism (Office of Environmental Commissioner).

Overall Recommendation

Based on the findings of the environmental scoping assessment, which concludes that all potential negative impacts associated to the proposed InterContinental Mining (Pty) Ltd's prospecting operations are minimal and practical mitigation measures are available. Equally, the positive impacts can be harnessed to increase the net marginal benefits relating to the socio-economic aspects of the operations.

The proposed operations is considered to have an overall low negative environmental impact and an overall moderate positive socio-economic impact (with the implementation of respective mitigation and enhancement measures).

Based on this, it recommended that the proponent must upon obtaining their Environmental Clearance Certificate (ECC), implement all appropriate management and mitigation measures and monitoring requirements as may be stipulated in their EMP and or as condition of the ECC. These measures must be undertaken to promote and uphold good practice environmental principles and adhere to relevant legislations by avoiding unacceptable impacts to the receiving environment.

The following is a summary of the likely negative impacts that have been assessed for the different phases of the proposed exploration activities:

- i. Land use (Likely impacts are negligible; the mining claims area and sites are isolated from the distant settlements, and conservation zones).
- ii. Noise (Likely impacts are low as the site is far from residential areas).
- iii. Ecological and biodiversity loss (Likely impacts are localized and low).
- iv. Health and safety (Overall likely impacts are low with correct PPE).
- v. Solid and hazardous waste management (Likely impacts are low with a solid waste management plan and minimal hydrocarbon fuel use).
- vi. Socioeconomic (Likely negative impacts are low)

Taking into consideration the findings of the environmental scoping assessment process and given the national and regional strategic requirements for infrastructure development and economic growth, it is the opinion of the EAP that the project benefits outweigh the costs and that the project will make a positive contribution towards steering Namibia on its pathway towards its vision of becoming a Logistic Hub.

Provided that the specified mitigation measures are applied effectively, it is recommended that InterContinental Mining (Pty) Ltd Investments are issued with an ECC in terms of the Section 32 of the EMA No. 7 of 2007 and it's EIA Regulations of 2012.

1. INTRODUCTION

The Environmental Management Act No. 7 of 2007 (also referred to as the EMA) and its Regulations promulgated in the Government Gazette No. 4878 of 2012, stipulates that for each developmental activity, which is listed as those that may not be undertaken without obtaining and Environmental Clearance Certificate (ECC), an Environmental Assessment (EA) must be conducted. The proposed handling, storage and transportation of fuel and mineral commodities triggers some listed activities in terms of the EMA.

Therefore, an environmental assessment must be conducted with an aim to identify, assess and ascertain potential environmental impacts that may arise as a result of undertaking the proposed operations. Hence, the environmental assessment is a process by which the potential impacts, whether positive or negative are predicted / identified, findings interpreted and communicating to interested and affected parties (I&APs) for inputs.

Additionally, this report presents findings of an environmental scoping process that evaluates the likely socio-economic and environmental effects the proposed operation, and further identifies suitable mitigation measures for avoiding or minimizing the predicted impacts. The envisioned EIA process was undertaken in a holistic approach encompassing different elements as shown in *Figure 1*.

Figure 1: Anticipated Environmental Assessment Timeline

1.1. PROJECT APPLICANT AND PROJECT OVERVIEW

InterContinental Mining (Pty) Ltd seek to undertake it business / operations on mining claims 69966 & 69967, in the Dorob National Park. Principally, the joint-venture intends to explore for Lithium (desktop geological study, collection of samples and identification of previous activity in the area where previous mining activities were conducted) by use of hand-held equipment and to small degree bulk sampling or mining, and develop the claims into mining license should they discover viable ore deposit.

1.2. PROJECT MOTIVATION (INCLUDING NEED AND DESIRABILITY)

Namibia is an up-and-coming source country for critical minerals, which are important for renewable energy technologies. The country has the potential to develop new mining projects for cobalt and lithium. Global lithium exploration and development company Lepidico Ltd is developing a lithium mine in western Namibia and is in discussion with multiple

U.S. companies on possible off-take for its lithium and by-products cesium and rubidium, which the U.S. Department of Interior lists as among the 35 minerals critical to national security. Desert Lion began shipping lithium ore in 2018, with a first shipment of 30,000 tons.

Mining contributes about 25% to the Namibian GDP income (Figure 2), and thus the largest contributor to the Namibian economy. As in many African countries, mining is a key source of mineral commodities essential for maintaining and improving standards of living. Most important, the Namibian government makes provision for its citizens to obtain various mining license in order to create self-employment or business opportunities.

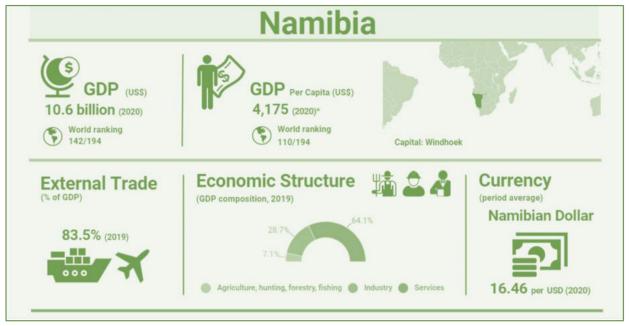

Figure 2: Outlook of Namibia's economic performance and the impact of mining on the economy

There are many companies engaged in exploration and mining activities for various metals / minerals. This creates opportunities that attracts international investment to support increased exploration activities particularly with an interest in finding lithium. A milestone in this respect is the establishment of Desert Lion Energy which began shipping lithium concentrate from Namibia's first large-scale lithium mine in the Erongo region of Namibia in April 2018, thus opening p further opportunities for other international companies.

InterContinental Mining (Pty) Ltd, is therefore presented an opportunity to venture into the sector by undertaking an exploration programme in respect in respect to Base and Rare Metals, Dimension Stone, Industrial Minerals, Non-Nuclear Fuel Mineral and Precious Metals

1.2.1. Need and Desirability

Overall, the exploration activities is expected to generate full time medium to long term direct employment for at least 5-10 workers. The majority of workers to be employed on the proposed exploration project are expected to be skilled and/or semi-skilled (general labourers and operators).

Critically, going ahead with the proposed activity creates potential for the following marginal net benefits:

- Contribution to Taxes and Royalty
- Technological Skill and Knowledge transfer
- Creates the most needed employment opportunities
- Attainment of particularly the SDGs 1 and 8 in Namibia

1.3. REQUIREMENTS FOR AN ENVIRONMENTAL IMPACT ASSESSMENT

While increased economic activities can stimulate demographic changes and alter social, economic and environmental practices in many ways. Adverse environmental and socioeconomic impacts have become a major area of concern for the business community, their customers, and other key stakeholders. As a result, companies seek to manage these impacts as part of their ethical and sustainable business conduct. Similarly, identifying, avoiding, mitigating and managing impacts, is a necessary condition InterContinental Mining (Pty) Ltd to undertake its operation in compliance with the environmental legislative requirements in Namibia.

To ensure that development activities are undertaken in an economic, social and environmental sound / sustainable manner, the Namibian Constitution and Environmental Management Act No. 7 of 2007 provides for an environmental assessment process.

The purpose of the environmental assessment and therefore this report are to ensure compliance of the proposed operations with the environmental legislation in respect to managing potential impacts associated with the proposed InterContinental Mining (Pty) Ltd's prospecting activities operations:

- Identifying potential socio-economic and environmental impacts
- Proposing management measures to avoid, prevent and of mitigate these
- Compile an Environmental Management for compliance monitoring and reporting on the implementation of the Environmental Clearance Certificate conditions

Table 1: List of activities identified in the EIA Regulations which apply to the proposed project

EMA 2007 Legislation	Description of activity	Relevance to this project
The project is listed as an activity requiring an environmental clearance certificate as per the following points from Regulation 29(subregulation 3) of	3.1 The construction of facilities for any process or activities which requires a license, right or other form of authorization, and the renewal of a license, right or other form of authorization, in terms of the Minerals (Prospecting and Mining Act), 1992. 3.2 Other forms of mining or extraction of any natural resources whether regulated by law or not.	The project involves both the construction of facilities for activities which requires a licenses (in terms of the Minerals Act 33 of 1992) and undertaking of relating to resource extraction (exploration i.e. geological
Government Notice No. 29 of 2012:	3.3 Resource extraction, manipulation, conservation and related activities.	sampling and sampling)
The project is listed as an activity requiring an environmental	9.1 "The manufacturing, storage, handling or processing of a hazardous substance defined in the Hazardous Substances Ordinance, 1974."	The project involves the haulage, storage and handling of a potential hazardous (fuel and lubricants
clearance certificate as per the following points from Regulation 29(sub- regulation 9) of Government Notice No. 29 of 2012:	9.2 "Any process or activity which requires a permit, license or other form of authorization, or the modification of or changes to existing facilities for any process or activity which requires an amendment of an existing permit, license or authorization or which requires a new permit, license or authorization in terms of a law governing the generation or release of emissions, pollution, effluent or waste."	In respect to the Petroleum Products and Energy Act 13 of 1990, the construction of fuel storage facility which may be an important component of the proposed activity requires a permit from a relevant authority.
	9.4 "The storage and handling of a dangerous goods, including petrol, diesel, liquid petroleum gas or paraffin, in containers with a combined capacity of more than 30 cubic meters at any one location."	The project involves the haulage, fuel from near-by towns to the exploration site
	9.5 "Construction of filling stations or any other facility for the underground and aboveground storage of dangerous goods, including petrol, diesel, liquid, petroleum, gas or paraffin."	Aspect of the project may t require the construction and maintenance of a fuel storage facility

Therefore, InterContinental Mining (Pty) Ltd appointed Enviro-Leap Consulting to conduct an environmental assessment and facilitate the process of obtaining and Environmental Clearance Certificate.

1.4. EIA TEAM

InterContinental Mining (Pty) Ltd to undertake the EIA required for the proposed project. A public participation process (PPP) forms an integral part of the Environmental Assessment Process to aid in identifying issues and possible alternatives for consideration. Details on the PPP are included in section 4 of this Scoping Report.

Table 2: The EIA Management Team

NAME	ORGANISATION	ROLE/ SPECIALIST STUDY UNDERTAKEN
Environmental Assessment Pr	ractitioners	
Shadrack Tjiramba	Enviro-Leap Consulting cc	Environment Practitioner
Vilho P. Mtuleni	Enviro-Leap Consulting cc	Internal Reviewer
Roland Mushi	Independent Specialist	Archaeology Assessment Specialist

1.5. DETAILS AND EXPERTISE OF THE EAP

Over the past four years the Enviro-Leap Consulting has been involved in a multitude of Environmental Assessment projects across SADC and within Namibia. The Environmental Practitioners of Enviro-Leap Consulting has a combined of more than 35 years' experience in the environmental sector (management and policy), ecological research and stakeholder engagement. Consequently, the team offers a wealth of experience and appreciation of the environmental and social priorities and national policies and regulations in Namibia.

1.6. OBJECTIVES OF THE ENVIRONMENTAL SCOPING ASSESSMENT

The primary objective of this EA Report is to present stakeholders, I&APs and the Competent Authority, the DEA, with an overview of the predicted impacts and associated management actions required to avoid or mitigate the negative impacts; or to enhance the benefits of the proposed InterContinental Mining (Pty) Ltd operations.

In broad terms, the 2012 EMA EIA Regulations (GG 4878) stipulates that an EIA Process must be undertaken providing to determine the potential environmental impacts, mitigation and closure outcomes, as well as the residual risks of any listed activity. Therefore, based on these (EIA Regulations), the objectives of the Environmental Assessment (EA) Process is to:

- determine the policy and legislative context within which the activity is located and note how the proposed activity complies with and responds to the policy and legislative context;
- describe the need and desirability of the proposed activity, including the need and desirability of the activity in the context of the preferred location;
- identify the location of the development footprint within the preferred site based on an impact and risk assessment process inclusive of cumulative impacts and a ranking process of all the identified development footprint alternatives focusing on the geographical, physical, biological, social, economic, heritage and cultural aspects of the environment;
- determine the nature, significance, consequence, extent, duration and probability
 of the impacts occurring to inform identified preferred alternatives; and the degree
 to which these impacts (a) can be reversed; (b) may cause irreplaceable loss of
 resources, and (c) can be avoided, managed or mitigated; and
- identify suitable measures to avoid, manage or mitigate identified impacts;

In terms of legal requirements, a crucial objective of the Environmental Scoping or EIA Report is to satisfy the requirements of EIA Regulations in respecting to obtaining an Environmental Clearance Certificate. This section regulates and prescribes the content of the Scoping Report and specifies the type of supporting information that accompany the submission of the ECC application to the Competent Authority.

2. PROJECT DESCRIPTION

This section provides an overview of the conceptual overview of the prospecting activities on Mining Claims 71556 -71558, sites and technology selection process for identifying the most suitable exploration techniques to be adopted.

2.1. OVERVIEW OF THE PAST AND PROPOSED EXPLORATION ACTIVITIES

Along the route leading to the proposed exploration site, numerous tracks revealing evidence of intensive presence of human activities were observed. Although it is difficult to distinguish the cause, the tracks may be attributed to individual exploration teams, small and medium scale miners and or tourists accessing the area for their varying interests. Human-induced disturbances in the form of vehicle traffic on the desert plains resulting in shearing and compression of the soil that extends to depths of 20cm is evident. At the proposed claims site, previous prospecting and mining has left trenches, pits and holes that were not rehabilitated.

The proposed exploration activities mainly consist of the following prospecting activities:

- <u>Geological mapping</u>: this mainly entails a desktop review of geological area maps and ground observations. This includes the review of geological maps of the area and onsite ground traverses and observations and an update where relevant, of the information obtained during previous geological studies of the area.
- <u>Lithology geochemical surveys</u>: rock samples shall be collected and taken for trace element analysis to be conducted by analytical chemistry laboratories to determine if sufficient quantities of base & rare or precious metal or other minerals of interest are present. Also, trenches or pits may be dug depending on the commodity (in a controlled environment e.g. fencing off and labelling activity sites) adopting manual or excavator to further investigate the mineral potential.
 - These consists of small pits (±20cm X 20cm X 30cm) will be dug where 1 kg samples can be extracted and sieved to collect 50 g of material. As necessary, and to ensure adequate risks mitigation, all excavations will either be opened and closed immediately after obtaining the needed samples or the sites fenced off until the trenches or pits are closed. At all times, the landowner and other relevant stakeholder will be engaged to obtain authorisation where necessary.
- <u>Geophysical surveys</u>: entails data collection of the substrata (in most cases service of an aero-geophysical contractor will be soured), by air or ground, through sensors such as radar, magnetic and electromagnetic to detect any mineralization in the area, and are conducted to ascertain the mineralisation.
 - Ground geophysical surveys shall be conducted, where necessary using vehicle-mounted sensors or handheld by staff members, while in the case of air surveys the sensors will be mounted to an aircraft, which then flies over the target area.
- <u>Bulk Sampling</u>: The Molopo Petalite mine is an old abundant mine found within the Dörob National park, the mine was shut down in 1972, in spite of large sorted mineralized materials (Ore containing Lithium, Tantalum and Tin) as per the sample analysis results, ((up to 1cm) cassiterite crystals occurrence local concentration of tin

in ore ranging from 0, 5-1, 5% was not extracted because of primitive beneficiation recovery methods and rates, **Figure 3**).

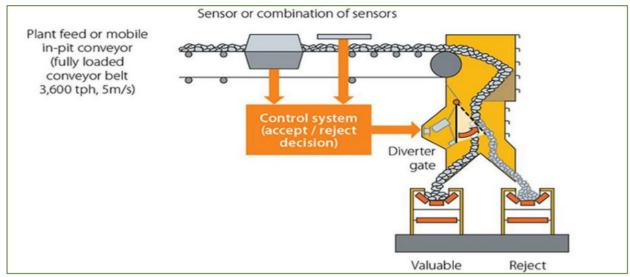

Figure 3: Bulk Sampling Model will be used for high grade Ore recovery

A typical sampling site will consist of a front-end loaders and excavator equipment, and overburden material is excavated, lithium ore extracted and stored in large bags prior to being exported to and a drill equipment parking and maintenance yard (including a fuel and lubricants storage facility).

2.2. DESRCIPTION OF COMMODITIES

2.2.1. Lithium

Lithium, together with Cobalt are key in manufacturing the batteries that power these electric vehicles, and considered to be some of the minerals that has sparked international investors to undertake prospecting activities in Namibia after lithium-bearing minerals, deposits were as recent as 2018 discovered in the Erongo Region.

2.3. PROJECT RATIONALE (MOTIVATION, NEED AND DESIRABILITY)

2.3.1 Project Motivation

The proposed activity responds to Namibia's strategic vision 2030 and the NDP5 of creating a conducive environment within which its citizens prospers and contribute to the national development goals by creating employment opportunities. Overall, this activity contribute to the nation's efforts of elevating poverty amongst the rural citizens.

Critically, going ahead with the proposed activity on the proposed mining claims creates a potential for the following marginal net benefits:

- Contribution Taxes and Royalty
- Technological Skill and Knowledge transfer
- Creates the most needed employment opportunities

2.3.2 Project Need and Desirability

Mining contributes about 25% to the Namibian GDP income, and thus the largest contributor to the Namibian economy. As in many African countries, mining is a key source of mineral commodities essential for maintaining and improving standards of living. Most important, the Namibian government makes provision for its citizens to obtain various mining license in order to create self-employment or business opportunities.

InterContinental Mining (Pty) Ltd, were therefore presented an opportunity to venture into the sector by undertaking an exploration programme in respect in respect to Base and Rare Metals, Dimension Stone, Industrial Minerals, Non-Nuclear Fuel Mineral and Precious Metals

Overall, the exploration activities is expected to generate full time medium to long term direct employment for at least 5-20 workers. The majority of workers to be employed on the proposed exploration project are expected to be skilled and/or semi-skilled (general labourers and operators).

2.4. PROJECT LOCATION

The location of the proposed Mining Claims area which constitute Mining Claims 69966 & 69967 is situated in Western Namibia (**Figure 4**), within the Dorob National Park in the Erongo Region and approximately 25 km north-east of the Uis Settlement.

The proposed claims, although situated with a conservancy, are in proximity (south-west, **Figure 5**) of an old molopo pit with asorted mineralized materials (Ore containing Lithium, Tantalum and Tin) as per the sample analysis results, ((up to 1cm) cassiterite crystals occurrence local concentration of tin in ore ranging from 0, 5-1, 5% was not extracted because of primitive beneficiation recovery methods and rates).

Figure 4: Locality map of the proposed Mining Claims 69966 & 69967 in the Erongo Region, Namibia.

Table 3: Corner coordinates of the proposed development site

Corner point	Latitude	Longitude		
A – MCs 69966 & 69967 Point 1	-21.006388°	14.974462°		
B – MCs 69966 & 69967 Point 2	-21.006612°	14.971811°		
C – MCs 69966 & 69967 Point 3	-21.012210°	14.973038°		
D - MCs 69966 & 69967 Point 4	-21.011681°	14.975534°		
F - MCs 69966 & 69967 Point 4	-21.017504°	14.974736°		
G - MCs 69966 & 69967 Point 4	-21.016685°	14.977239°		

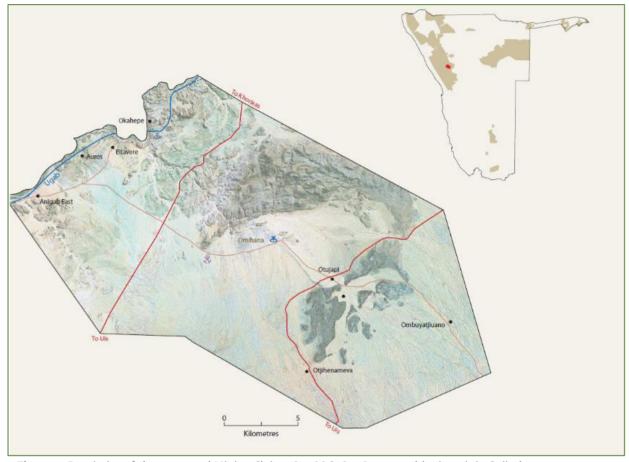

Figure 5: Proximity of the proposed Mining Claims 69966 & 69967 to an old mine pit in Otjimboyo conservancy

2.4. SUPPORTING INFRASTRUCTURE

2.4.1 Basecamp

Given the location of the mining claims and that it is situated in a community conservancy i.e. Otjimboyo Conservancy, an entirely new base-camp is not primarily recommended but rather a suitable community campsite must be rented for the duration of the exploration and or mining activity. Otherwise, a suitable site must be identified in collaboration with all relevant authorities including the Traditional Authority. Where practical and possible, it is strictly recommended that for unskilled labour, local community members are employed and thus accommodated at their existing homestead to mitigate and reduce potential conflict with the conservancy wildlife and livestock management protocols.

During the prospecting period, it is anticipated that about 10 - 15 persons will be employed, although only four staff are allowed to lodge on-site on an alternating (rotating) basis. The

project specialists such as geologists, field assistants, geo-technicians and sampling crew, will be hosted on either a daily or special visit basis, and thus might not all be on-site simultaneously.

Therefore, it is highly recommended that temporary ablution facilities must be provided and limited to within the existing base-camp footprint pre-identified national park campsites, and the necessary authorization must be obtained prior to installation of any such facility.

In terms of waste generation and management, the predominant type of waste that will be generated during the exploration activities, in small volumes, is domestic waste i.e. packaging material (paper, wooden box, plastic sampling bags), and potentially hydrocarbons from diesel oil should a power generator needed. Domestic waste must be stored in heavy duty garbage bags and disposed of correctly at the Henties Bay waste disposal site (refer to EMP commitments).

2.4.2 Water supply

Water will, at this stage only be required mainly for domestic use and will be sourced from the Henties Bay Municipality and transported by truck in 10 000 litres water tanks, thus equally stored in tanks at the base-camp site. Where portable ablution facility are provided, it is recommended that they are emptying and sewer transported by the returning water supply truck.

2.4.3 Power supply

In case where the exploration activity advances to the bulk sampling (trenches) stage, the various machinery and equipment (front-end loader and excavator) required digging the trenches are self-powered by means diesel engines, hence there is need for on-site fuel (diesel) storage in either small mobile bowser or barrel drums on a concrete slab or base-camp. The excavator will either be refuelled with Jerry cans or directly from the bowser.

Basic energy requirement may be met through a portable petrol/diesel generator may only be utilised to meet the domestic energy requirements.

2.4.4 Access roads / tracks

The area is accessible via the D3714 and then branching left onto the D3715 heading to Otuyapi Village, and then through the gravel track leading to Omihana village. From this track another small track branching south of Omihana Village leads to the proposed mining claims site. Consequently the mining claims area is accessible by 2x4 / 4x4 pick-up vehicle by the existing tracks and otherwise, the sensitive section of the area will only be accessed by foot to ensure minimum impacts on the receiving environment

2.5. DECOMMISSIONING AND CLOSURE PHASE

Considering evidence of previous negligence of in regard to closure and site rehabilitation, it is necessary that measures are proposed in respect to managing the site on completion of the exploration activity, these are identified and presented in the appropriate Environmental Management Plan.

3. DESCRIPTION OF THE AFFECTED ENVIRONMENT

This chapter of the Scoping Report provides an overview of the affected environment for the proposed mineral exploration activities within the mining claims area. The receiving environment is understood to include biophysical, socio-economic and heritage aspects which could be affected by the proposed development or which in turn might impact on the proposed development.

3.1 BIOPHYSICAL ENVIRONMENT

This area is known as an angler's paradise, with kabeljou, galjoen and steenbras the most prized species. But it also contains a few surprises. Extensive lichen fields are found north of Wlotzkasbaken and Cape Cross, while the Messum Crater in the north contains San rock paintings and archaeological sites from Damara nomads. It is bordered to the north by the Ugab River and the Skeleton Coast Park. The Omaruru River bisects it, while the Swakop River is situated just south of its boundary. The towns of Henties Bay and Swakopmund are found within its boundaries, along with the hamlet of Wlotzkasbaken. The Cape Cross Seal Reserve is a separate reserve in the northern section of the area.

3.1.1 Climatic Conditions

About 22% of Namibia's land is classified as desert (hyper-arid), 70% is classified as arid to semi-arid and the remaining 8% is classed as dry sub-humid (Mendelsohn et al. 2003). The average maximum temperature at Cape Cross which is the closest settlement to the study area, ranges between 30°C - 36°C during the hottest month (November – April) while the average minimum in winter ranges between 5°C and 25°C are common (Mendelsohn et al. 2003).

Rainfall is highly erratic and unpredictable with an inter-annual coefficient of variation that ranges from about 30% in the north-east to over 100% in the driest areas. Around the project area and across the desert biome, annual average rainfall ranges between 10 mm 120 mm per annum, and this decreases along the east-west gradient to annual averages of less 20 mm per annum. At Henties Bay, the prominent winds blows from South South-West (SSW) and East North-East (ENE, see **Figure 9**) at speeds reaching more than 22 km/s (Robertson et. al, 2012).

All of Namibia, except for the coastal plains, experiences humidity of below 30% during the day for much of the year - in the north-east for about six months, the north-centre for seven months, the central area for eight months and in the south for all 12 months. High temperatures and low humidity result in high rates of evaporation. Evaporation rates from an open body of water inland of the coastal plains range from about 2000 mm to over 2660 mm per annum (Olivier, 1995).

3.1.2 Geology

The claims are located within the Northern Zone (NZ) of the Damara orogenic belt, which is geologically characterised by rocks of Nosib and Swakop Groups mainly. According to (Miller,

2008), this zone has been thrusted northward over the Otavi, Mulden and pre-Damara rocks along the Khorixas-Gaseneirob thrust.

A study financed by the Namibian – German governments cooperation under the BGR program, classified four linear pegmatite belts within the Damara Orogen and all which strike northeast – southwest: Brandberg West – Goantagab, Cape Cross – Uis, Nainais – Kohero and Sandamap – Erongo, with the latter connected to the Karibib Pegmatite District (Schneider 1992).

The distribution of lithium in Namibia, which significantly occurs primarily within pegmatites. These Precambrian and early Namibian pegmatites are restricted to two different areas respectively, the Damara Orogen in north-central Namibia and the Namaqua Metamorphic Complex in southern Namibia (**Figure 10**). Of particular interest to proposed Mining Claims 71556 -71558 is Cape Cross – Uis Pegmatite District – Erongo (Schneider 1992).

In the south, Lithium-Caesium-Tantalum (LCT) pegmatites occur in two areas: Tantalite-Valley, south of Warmbad in close proximity to the northwest-trending Tantalite Valley Shear Belt and the Sandfontein-Ramansdrift area close to the Orange River.

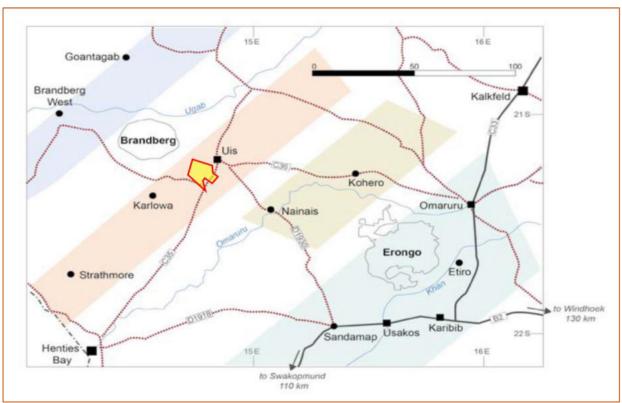

Figure 7: Pegmatite belts in north-central Namibia from west to east: Brandberg West – Goantagab, Cape Cross – Uis, Nainais – Kohero and Sandamap – Erongo as well as the Karibib Pegmatite District (after Geological Survey of Namibia 2002).

Topographically, the area is characterized by the presence of localized mountainous areas with flat regions in between covered by eroded sand. Relief elevation ranges from 800m towards the southeast to maximum heights of up to 1600m to the west. The tectonic structure of the area and the erosional processes, together with the climate have conditioned the formation of a peculiar elongated and folded-shape of the topography

3.1.3 Terrestrial Ecology and Sensitivity

Namibia's vegetation and biomes are classified into five major types, shown in (Figure 6). These are, the Namib Desert, Nama Karoo, Succulent Karoo and the Trees and Shrub savannah. The proposed project area fall mainly within the Desert biome and thus the fauna and flora key receptors of environmental impact particularly in case of trampling and vehicle tracks, potential poaching and ground contamination resulting from the project activities.

Overall terrestrial diversity of plants and animals is highest in the north-eastern parts of Namibia (**Figure 8**, green map indicator), because of the higher rainfall and presence of wetlands and forest habitats that are not found elsewhere in the country. Many species in the north are also more tropical, with ranges that extend into neighboring countries to the north and north-east. Species richness is highest in Namibia's mesic wetlands and woodlands in the vertebrate classes particularly (Barnard 1998).

However, due to its low productivity, the western desert arid zone is endowed with modest diversity of species compared to more mesic habitats. What is most distinctive about Namibian biodiversity is its high degree of endemism within the western (Erongo) region (Barnard 1998).

Unlike the concentration of biodiversity in the north-east, the great majority of Namibia's endemic species are found in the dry western and north-western regions (Figure 6, brown map indicator) (Barnard 1998, Mendelsohn et al. 2002). The patterns of endemism reflect the importance of arid habitats in supporting unique and specially adapted species.

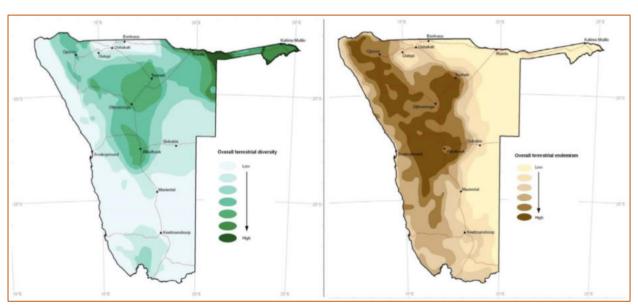

Figure 8: Shows a comparison of overall terrestrial species diversity (green) against overall endemism (brown), with the most endemism observed within the central to north western region (including the EPL area) which may be classified as a "Red Flag" zone in terms of environmental risks.

The vegetation in the study area is diverse and includes a number of species endemic to the central and northern Namib (Figure 9) as well as various protected species such as Gomphocarpus fruticosus (milkweed), Zygophyllum simplex (simple Zygophyllum), Zygophyllum stapffii (dollar-bush), Arthraerua leubnitziae (pencil bush), Monechma cleomoides (Namib perdebos) and Kleinia longiflora (sjambok bush).

Figure 9: Shows a general composition of vegetation species types consisting mainly of annual grass and shrubs Euphorbia damarana shrubland, and in semi-mountainous gravel plains of the Namib Desert in proximity of the Uis Settlement in Erongo

Every vegetation type supports at least one, more often several endemic or protected species. As a result of this, as well as the low recovery potential of the vegetation, there are no vegetation types of low sensitivity. Classified as highly sensitive are the granite and dolerite outcrop shrublands and their associated vegetation types in the vicinity, the camel thorn shrubland in the north-east of the study area, the tamarisk shrubland of the Erongo mountain landscape.

In the Namib, endemics are associated with the dunes, rocky inselbergs and hills, and the gravel plains. For instance, approximately 60 reptile species (50% of all Namibian endemic *Euphorbia damarana* shrubland) reptiles) are endemic to, or found mainly in, Namibia's Namib Desert (Griffin 1998).

In birds, the greatest diversity of southern African endemics is centered on the arid savannah and Karoo biomes and extends into the escarpment (Brown et al. 1998). Highland areas of the country, including Waterberg, Khomas Hochland, Karas Mountains, Brandberg, inselbergs in the Sperrgebiet and the Karstveld are particularly important for many endemic plants (Mendelsohn et al. 2002).

In respect to the InterContinental Mining (Pty) Ltd.'s operations, habitats of special ecological importance and therefore requiring special care for both richness of species generally and of endemic species include (Barnard 1998):

- The Namib gravel plains;
- The winter-rainfall desert zone

3.1.7 Protected Terrestrial Areas

Ecologically, the project area falls within the Otjimboyo conservancy, one of the smallest conservancies in the Erongo Region. There are only about 342 persons living in 8 settlements in the area. Due to its size the conservancy seems to have been neglected in support and is

one of the most vulnerable communities in Namibia as they bear the brunt of climate change induced drought.

In addition, the area encompasses the Brandberg Mountain, the highest peak in Namibia (2,573 m), with a number of world renowned Bushmen paintings as well as archaeological remains. In order to implement both the management and utilization, as well as zonation plan, seven community game guards (CGCs) are appointed and paid by the conservancy.

3.2 SOCIO-ECONOMICAL ENVIRONMENT

3.2.1 Demographic Profile

Until independence in 1990, the area was almost fully supported by a tin and tantalite mine operated by a South African company in Uis town. The latter provided essential jobs and infrastructure and many families moved to Uis to sustain their livelihoods. The mine however closed in 1990, leaving the community residing in the township with no alternative economic activity.

As a result, unemployment, particularly among the youth, and poverty sharply rose and access to basic infrastructure remained very limited. From the last available census data, 46 % of the labor force is now unemployed, 22 % of people of 15 years and above have never attended school, while 57 % of households have no toilet facility (NPC 2003). Apart from few local government positions, economic opportunities have become rare; households have had to resort, as a source of income, to small scale farming, illegal mining and informal small businesses, but also importantly to pensions and cash remittances (Mosimane 2000).

With limited farming opportunities and the existence of unique cultural and natural resources that attracted a growing number of domestic and South African tourists since the beginning of the years 2000, tourism was increasingly seen as an opportunity to generate alternative critical income. Young people started selling semi-precious stones to tourists along the road and looked for any other income-generating activity based on local resources available (including small-scale mining).

All income retained from different economic activities operated is deposited on the conservancy fund (bank account). This money is then spent to cover conservancy operational costs (fuel, car maintenance, organizing transport and food for the AGM, salaries for conservancy staff); when money remains, it is either saved, spent for infrastructure development (e.g. an ambulance was proposed) or distributed to members as cash dividend, according to decisions taken by members at the previous AGM.

3.2.2 Heritage and Culture Profile

In Namibia, archaeological resources are often vulnerable to developmental and mining impacts. Typical sites do not only include those found in the mountains, hills and outcrops but also those generally found in the flat areas (Namib Desert) and or in riverbeds.

Some of these site types might be obvious to some observer, such as rock art or historical mines. Others are quite ambiguous and might appear less significant than they are, such as pre-colonial stone features. This means that it is very difficult for mining projects to avoid

damage to archaeological heritage sites if they have not been located, identified and made known during EIA process.

Therefore, given the nature, scope and scale of the proposed exploration activity and particularly that it entails minimum use mechanical equipment an archaeological specialist study was deemed not necessary although highly recommended for the next phase of the mine development projects. Critically, the proponent is cautioned to at all time strictly adhere with the search and find procedure in accordance with the stipulations of the Namibian National Heritage Act (No. 27 of 2004) in the highly unlikely event that artifacts are found in the mining claims area.

In the light of the evidence found during the field assessment and other desktop review of previous field surveys, it can be concluded that should a detailed heritage assessment be necessary and conducted it may yield the following results:

- Pre-Quaternary palaeontological evidence in insignificant quantity and mainly in the vicinity of Palaeozoic shale outcrops more towards the Uis and other community settlements.
- Generalized occurrence of mid- to late Pleistocene to early Holocene artefact scatters primarily between the 21°25′24″ and 21°39′40″ South latitude.
- Moderately high density of late Holocene to recent pre-colonial archaeological sites throughout the extent of the claims area, including burial cairns and remains of nomadic pastoral encampments, as well as possibly of some rock art sites and rock shelter sites containing sealed occupation debris
- Generalized occurrence of colonial era sites, including farm settlements, battlefield sites and related remains.

Therefore, it remains necessary that in the absence of extensive heritage and culture studies in the region there remains a possibility of encountering numerous undeclared artefacts / sites of heritage importance. A search and find procedure (**Appendix C**) must be strictly followed in accordance with the stipulations of the Namibian National Heritage Act in the highly unlikely event that artefacts are found in the sand mining area.

4. APPROACH TO EIA PROCESS AND PUBLIC PARTICIPATION

This chapter presents the approach to the Environmental Scoping Assessment process, for the proposed InterContinental Mining (Pty) Ltd.'s activity and gives particular attention to the legal context and guidelines applicable to this assessment. The assessment approach and the steps in the Public Participation component of this scoping report were undertaken in accordance with Regulations 29 and 30 of Government Notice No. 30 of 2012. Overall, this section highlights information including the approach to stakeholder engagement, identification of issues, overview of relevant legislation, and key principles and guidelines that provide the context for this scoping assessment process. Hence, in a nutshell, the purpose of the environmental assessment is to:

- Address issues that have been identified through the Scoping Process;
- Assess alternatives to the proposed activity in a comparative manner;
- Assess all identified impacts and determine the significance of each impact; and
- Recommend actions to avoid/mitigate negative impacts and enhance benefits.

4.1 OVERVIEW OF APPROACH ADPTED FOR COMPILING THE SCOPING AND EMP REPORTS

The objectives of the environmental scoping assessment are noted in Section 1 of this Report. Section 6 of this Scoping Report includes a summary of the findings, the overall conclusions and the recommendations. The Scoping Report was made available for a 30-day I&AP and authority review period, as outlined in the EMA Regulations of 2012. Although adverts were put in two local newspapers (01-07 April and 08 -13 April 2022) and Windhoek Observer 05 April 2022), with several responses or inputs were received (see Appendix A for detailed report).

As previously noted, the Scoping Report includes an Environmental Management Plan (EMP, **Appendix B**). The EMP is based broadly on global environmental management principles and embodies an approach of continual improvement and mitigation actions.

These are drawn primarily based on the identified potential impacts for both the construction and operational phases of InterContinental Mining (Pty) Ltd.'s proposed activity. If the project components are decommissioned or re-developed, this will need to be done in accordance with the relevant environmental standards and clean-up / remediation requirements applicable at the time.

4.2 LEGAL CONTEXT FOR THIS EIA

In accordance with the provisions of the Environmental Impact Assessment (EIA) Regulations No. 30 of 2012 gazette and the Environmental Management Act, (EMA), 2007, (Act No. 7 of 2007), the activity to be undertaken by InterContinental Mining (Pty) Ltd may not be undertaken without an Environmental Clearance Certificate.

4.3 LEGISLATION AND GUIDELINES PERTINENT TO THIS ENVIRONMENTAL ASSESSMENT

As the main source of legislation, the Namibian constitution makes provision for the creation and enforcement of applicable legislation. In this context and in accordance with its constitution, Namibia has passed numerous laws (those of relevant to this project are listed in Table 2) intended to protect the natural environment and to mitigate adverse environmental impacts.

Namibia's policies provide the framework to the applicable legislation. Whilst policies do not often carry the same legal recognition as official statutes, policies can be and are used in providing support to legal interpretation when deciding cases. Below are several of the key legislations applicable to the governance of certain component / aspects of the proposed operation activity. Key acts and policies currently in force include:

- Namibia's Environmental Assessment (EIA) Policy for Sustainable Development and Environmental Conservation (1995)
- Environmental Management Act (No. 7 of 2007);
- Environmental Impact Assessment Regulations (Government Notice No. 30 of 2012)
- Namibia Agriculture Policy of 2015
- Namibia Vision 2030, and other national development plan e.g. Harambee Prosperity Plan
- Social Security Act, 1994 (Act No. 34 of 1994) and the Affirmative Action (Employment) Act, 1998 (Act No. 29 of 1998)

4.3.1 Environmental Management Act No. 7 of 2007

The environmental management act No.7 of 2007 aims to promote the sustainable use of natural resources and provides the framework for the environmental and social impact assessment, demands precaution and mitigation of activities that may have negative impacts on the environment and provision for incidental matters. Furthermore, the act provides a list of activities that may not be undertaken without an environmental clearance certificate.

The purpose of the Environmental Management Act is:

- a) to ensure that people carefully consider the impact of developmental activities on the environment and in good time
- b) to ensure that all interested or affected people have a chance to participate in environmental assessments
- c) To ensure that the findings of environmental assessments are considered before any decisions are made about activities which might affect the environment see *Figure 15*.

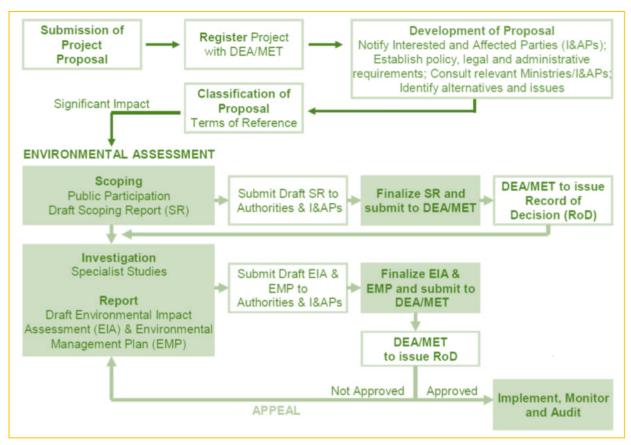

Figure 15: Illustration of the environmental assessment process in Namibia (Source: Risk Based Solution)

4.3.2 Environmental Assessment Policy (1995)

The Environmental Assessment Policy for Sustainable development and Environmental Conservation emphasize the importance of environmental assessments as a key tool towards implementing integrated environmental management. Sets an obligation to Namibians to prioritize the protection of ecosystems and related ecological.

The policy subjects all developments to environmental assessment and provides guideline for the Environmental Assessment. The policy advocates that Environmental Assessment take due consideration of all potential impacts and processes mitigations measures should be incorporated in the project design and planning stages (as early as possible).

4.3.12 Minerals Act

This Act No. 33 of 1992 provides a legal framework for regulating and governing all activities that explicitly entails the prospecting, exploration and mining of minerals within the boundaries of Namibia and the Ministry of Mine and Energy is the competent authority in this regard.

It also makes explicit reference to the protection and conservation of the natural environment by requiring for the development of an environmental impact assessment and management plan in which measures to avoid and or mitigate potential impacts relating to minerals development activities are clearly considered.

4.3.3 Other Legal Requirements and relevance to the proposed activity

In addition to the EMA and the Environmental Assessment Policy, there exist other regulatory frameworks that MDL must comply with. This is due to the supporting infrastructure that are needed to compliment the proposed logistics hub. As such, MDL will be required to obtain additional specific permits for the supporting infrastructure as listed in table 4 below. The process of obtaining the additional permits can be undertaken concurrently to the EIA process.

Furthermore, the proponent has the responsibility to ensure that the project activities conform to all other relevant legal documents and guidelines as listed in *Table 4* below).

Table 5: Other relevant legislation and applicability thereof

Legislation	Relevance			
Labour Act, 1992, (Act No. 6 of 1992) and Regulations Related to Health and Safety of Employees	 Labour matters, rights and duties of employees. Health and Safety of Employees Construction safety; Electrical safety; Machinery safety; Hazardous substances; Physical hazards and general provisions; 			
Social Security Act, 1994 (Act No. 34 of 1994) and the Affirmative Action (Employment) Act, 1998 (Act No. 29 of 1998)	 Establishment of the Social Security Commission Administration of a pension and incidental matters fund – affirmative employment opportunities 			
The Forest Act	 Declaration of protected areas in terms of soils and water resources Proclamation of protected species of plants and the conditions under which these plants can be disturbed, conserved, or cultivated. 			
Nature Conservation Amendment Act	 Declaration of protected areas and protected species. 			
National Heritage Act	 Protection and conservation of places and objectives of significance, as all archaeological and paleontological objects belong to the state 			

4.3.4 Precautionary and Polluter Pays Principles

The Precautionary Principle is worldwide accepted when there is a lack of sufficient knowledge and information about proposed development possible threats to the environment. Hence if the anticipated impacts are greater, then precautionary approach is applied.

Equally, the Polluter Pays Principle ensures that the proponent takes responsibility of their actions. Hence in cases of pollution, the proponent bears the full responsibility and cost to clean up the environment.

4.4 PRINCIPLES FOR PUBLIC PARTICIPATION / CONSULTATION

The PPP for this Scoping Process was driven by a stakeholder engagement process that includes inputs from authorities, I&APs and the project proponent. In respect to provisions of the EIA Regulations, "Public Consultation" means a process referred to in regulation 21, in which potential interested and affected parties are given an opportunity to comment on, or raise issues relevant to, specific matters. This stems from the requirement that people have a right to be informed about potential decisions that may affect them and that they must be afforded an opportunity to influence those decisions. Effective public participation also improves the ability of the Competent Authority (CA) to make informed decisions and results in improved decision-making as the view of all parties are considered.

Contrary, it is important to recognize and highlight two key aspects of public participation which must be considered at the outset:

- There are practical and financial limitations to the involvement of all individuals within a PPP. Hence, public participation aims to generate issues that are representative of societal sectors, not each individual. Consequently, the PPP is designed to be inclusive of a broad range of sectors relevant to the proposed activity.
- The PPP will aim to raise a diversity of perspectives and will not be designed to force consensus amongst I&APs. Certainly, diversity of opinion rather than consensus building is likely to enrich ultimate decision-making. Therefore, where possible, the PPP will aim to obtain an indication of trade-offs that all stakeholders (i.e. I&APs, technical specialists, the authorities and the development proponent) are willing to accept with regard to the ecological sustainability, social equity and economic growth associated with the project.

4.5 PUBLIC PARTICIPATION PROCESS

The key steps and or approach adopted for this particular Scoping assessment has been confirmed with the DEA through the registration of the proposed activity / operations on their Online EA system.

All advertisements, notification letters and emails etc. served to notify the public and organs of state, on both the call for registration as I&APs and of the availability of the Scoping and EMP reports for an opportunity to comment or provide input on the reports. Despite the national Lockdown due to the COVID19 pandemic, which affected the possibility for public meetings, adverts were placed consecutively (at 14 days interval) in two local newspapers the Namibian Sun (01-07 April and 08 -13 April 2022) and Windhoek Observer 05 April 2022) in order to notify and inform the public of the proposed projects and invite I&APs to register.

Overall, Enviro-Leap Consulting received only three registration of Interested and Affected Parties (I&APs) which consist of only one member of the public and two representatives of the Ministry of Environment, Forestry and Tourism's department of Environmental Affairs

and Forestry which is also the relevant competent Authority in respect to obtaining an environmental clearance certificate for listed activities.

Complementary to the registration of I&APs, a public meeting was organised at the Uis Settlement's community hall, however with a very low attendance, where the proposed project was introduced to the community and inputs sought in attempt to ensure that the general public was afforded an opportunity to contribute the planning of the prospecting project.

Several advertisement posters were also distributed and posted at key social gathering sites in the Uis Settlement such as at the community hall, shopping and tourism information centres evidence of these are presented below.

The correspondence sent to or received from I&APs and other competent authorities during the Scoping Phase were incorporated into the stakeholder engagement report appended to this report (**Appendix A**).

4.6 AUTHORITY CONSULTATION DURING THE EIA PHASE

Authority consultation is integrated into the PPP, with additional one-on-one meetings held with the lead authorities, where necessary. A pre-application meeting was scheduled with the relevant competent authorities prior to the Lock-down, however were later cancelled. It is proposed that the Competent Authority (DEA) as well as other lead authorities be consulted as necessary and at various stages during the application review process of the DEA. During the Scoping phase, the following authorities were identified and consulted (see **Appendix C**) for the purpose of consultation:

- Department of Environmental Affairs, Ministry of Environment, Forestry and Tourism
- Ministry of Mines and Energy

4.7 APPROACH TO IMPACT ASSESSMENT AND SPECIALIST STUDIES

Potential environmental impacts were identified through both desktop literature review and consultation with I&APs, regulatory authorities, specialist and Enviro-Leap Consulting. In case of social impacts, the assessment focused on third parties only (third parties include members of the public and other local and regional institutions) and did not assess health and safety impacts on workers because the assumption was made that these aspects are separately regulated by health and safety legislation, policies and standards.

The impacts are discussed under issue headings in this section. The discussion and impact assessment for each sub-section covers the construction, operational, decommissioning and closure phases where relevant. This is indicated in the table at the beginning of each sub-section. Included in the table is a list of project activities/infrastructure that could cause the potential impact per farming phase. The activities/infrastructure that are summarized in this chapter, link to the description of the proposed project (see Section 5 of the EIA report).

Mitigation measures to address the identified impacts are discussed in this section and included in more detail in the ERCP report that is attached in **Appendix B.** In most cases (unless otherwise stated), these mitigation measures have been taken into account in the assessment of the significance of the mitigated impacts only.

Both the criteria used to assess the impacts and the method of determining the significance of the impacts is outlined in *Table 6*. This method complies with the method provided in the Namibian EIA Policy document and the draft EIA regulations. *Part A* provides the approach for determining impact consequence (combining severity, spatial scale and duration) and impact significance (the overall rating of the impact). Impact consequence and significance are determined from *Part B* and *C*. The interpretation of the impact significance is given in *Part D*. Both mitigated and unmitigated scenarios are considered for each impact.

Table 6: Criteria for Assessing Impacts

		Table 6: Criteria for Assessing Impacts			
		PART A: DEFINITION AND CRITERIA			
Definition of SIGNIFICANCE		Significance = consequence probability			
Definition of CONSEQUENCE		Consequence is a function of severity, spatial extent and duration			
Criteria for ranking of the SEVERITY/NATURE	Н	Substantial deterioration (death, illness or injury). Recommended level will often be violated. Vigorous community action. Irreplaceable loss of resources.			
of environmental impacts	M	Moderate/measurable deterioration (discomfort). Recommended level will occasionally be violated. Widespread complaints. Noticeable loss of resources.			
	L	Minor deterioration (nuisance or minor deterioration). Change not measurable/will remain in the current range. Recommended level will never be violated. Sporadic complaints. Limited loss of resources.			
	L+	Minor improvement. Change not measurable/will remain in the current range. Recommended level will never be violated. Sporadic complaints.			
M+		Moderate improvement. Will be within or better than the recommended level. No observed reaction.			
	H+	Substantial improvement. Will be within or better than the recommended level. Favorable publicity.			
Criteria for ranking the	L	Quickly reversible. Less than the project life. Short-term			
DURATION of impacts	M	Reversible overtime. Life of the project. Medium-term			
	Н	Permanent beyond closure – Long-term.			
Criteria for ranking the	L	Localized-Within the site boundary.			
SPATIAL SCALE of	M	Fairly widespread–Beyond the site boundary. Local			
Impacts	Н	Widespread – Far beyond site boundary. Regional/national			

Impacts H Widespread – Far beyond site boundary. Regional/national								
PART B: DETERMINING CONSEQUENCE								
SEVERITY = L								
DURATION Long-term H Medium Medium Medium								
	Medium term	M	Low	Low	Medium			
	Short-term	L	Low	Low	Medium			
			SEVERITY = M					
DURATION	Long-term	Н	Medium	High	High			
	Medium term	M	Medium	Medium	High			
	Short-term	L	Low	Medium	Medium			
			SEVERITY = H					
DURATION	Long-term	Н	High	High	High			
	Medium term	M	Medium	Medium	High			
	Short-term	L	Medium	Medium	High			
			L	M	Н			
Localized Within Fairly widespread Widespread Far site boundary Beyond site boundary boundary boundary								
SPATIAL SCALE								

PART C: DETERMINING SIGNIFICANCE							
	Definite/Continuous	Н	Medium	Medium	High		
(of exposure to	Possible/frequent	M	Medium	Medium	High		
impacts)	Unlikely/seldom	L	Low	Low	Medium		
			L	M	Н		
				CONSEQUENCE			

PART D: INTERPRETATION OF SIGNIFICANCE				
Significance Decision guideline				
High It would influence the decision regardless of any possible mitigation.				
Medium It should have an influence on the decision unless it is mitigated.				
Low	It will not have an influence on the decision.			

^{*}H = high, M = medium and L = low and + denotes a positive impact.

This section outlines the assessment methodology and legal context for specialist studies, as recommended by the DEA 2006 Guideline on Assessment of Impacts. In addition to the above, the impact assessment methodology includes the following aspects:

Spatial extent – The size of the area that will be affected by the impact/risk:

- Site specific;
- Local (<10 km from site);
- Regional (<100 km of site);
- National or International (e.g. Greenhouse Gas emissions or migrant birds).

Consequence – The anticipated consequence of the risk/impact:

- Extreme (extreme alteration of natural systems, patterns or processes, i.e. where environmental functions and processes are altered such that they permanently cease);
- Severe (severe alteration of natural systems, patterns or processes, i.e. where environmental functions and processes are altered such that they temporarily or permanently cease);
- Substantial (substantial alteration of natural systems, patterns or processes, i.e. where environmental functions and processes are altered such that they temporarily or permanently cease);
- Moderate (notable alteration of natural systems, patterns or processes, i.e. where the environment continues to function but in a modified manner); or
- Slight (negligible alteration of natural systems, patterns or processes, i.e. where no natural systems/environmental functions, patterns, or processes are affected).

Duration – The timeframe during which the impact/risk will be experienced:

- Short term (less than 1 year);
- Medium term (1 to 10 years);
- Long term (the impact will cease after the operational life of the activity (i.e. the impact or risk will occur for the project duration)); or
- Permanent (mitigation will not occur in such a way or in such a time span that the impact can be considered transient (i.e. the impact will occur beyond the project decommissioning)).

Probability – The probability of the impact/risk occurring:

- Very likely or Likely;
- Unlikely or Very unlikely; and
- Extremely unlikely

5. ASSESSMENT OF ALTERNATIVES AND IMPACTS

5.1 ASSESSMENT OF IMPACTS AND MITIGATION

This chapter discusses the alternatives, as well as the selection process of the preferred alternatives that have been considered and assessed as part of the Scoping Phase. The 2012 EIA Regulations (GG4878) define "alternatives", in relation to a proposed activity, "as different means of meeting the general purpose and requirements of the activity, which may include alternatives to the:

- property on which or location where the activity is proposed to be undertaken;
- type of activity to be undertaken;
- design or layout of the activity;
- technology to be used in the activity; or
- operational aspects of the activity; and
- Includes the option of not implementing the activity".

The Scoping Report therefore provided a full description of the process followed to reach the proposed preferred activity, site and location within the site. It further includes the following as a minimum:

- The consideration of the no-go alternative as a baseline scenario;
- A comparison of the reasonable and feasible alternatives; and
- Providing a methodology for the elimination of an alternative.

5.1.1 NO-GO ALTERNATIVE

The no-go alternative assumes that the proposed project will not go ahead i.e. the proposed InterContinental Mining (Pty) Ltd.'s exploration activities does not realize. This alternative entails that the mining development (exploration and eventually mining) would not drive any environmental change and result in no additional environmental impacts on the project site (claims area).

It favors the *status quo* or baseline against which other alternatives are compared and will be considered throughout the report. However, the likely negative environmental impacts of other current and future user that may still happen in the absence of the proposed activities includes: natural dust and generation of particulate matter during windy event particularly resulting from other regional economic activities such as livestock ranching, mining and tourism, pollution and environmental degradation associated with current land use within and around the proposed mining claims site.

Therefore, in terms of the "No-go Alternative", potential economic gains that may never be realized if the proposed project activities do not go-ahead include: loss in income for the town and community at large, unemployment and the loss of socio-economic benefits derived from potential extraction and export of mineral commodity. Most importantly, is the reduced regional integration in terms of trade and investment, loss of direct and indirect contracts and employment opportunities, export earnings, foreign direct investments and various taxes payable to the Government.

5.1.5 CONCLUDING STATEMENT ON ALTERNATIVES

Namibia is an up-and-coming source country for critical minerals, which are important for renewable energy technologies. The country has the potential to develop new mining projects for cobalt and lithium. Global lithium exploration and Development Company Lepidico Ltd. is developing a lithium mine in western Namibia and is in discussion with multiple U.S. companies on possible off-take for its lithium and by-products cesium and rubidium.

There are many other companies engaged in the exploration and mining activities for various metals / minerals including InterContinental Mining Namibia. This creates opportunities that attracts international investment to support increased exploration activities particularly with an interest in finding lithium. InterContinental Mining (Pty) Ltd, is therefore presented an opportunity to venture into the sector by undertaking an exploration programme in respect in respect to Base and Rare Metals, Dimension Stone, Industrial Minerals, Non-Nuclear Fuel Mineral and Precious Metals

A key consideration in respect to the proposed project alternatives, is that of the claim's location / site particularly considering that it falls within a park environment and in proximity to the Dorob National Park. Primarily, the key objective in respect to conservancies or national park is conservation of particularly wildlife, cultural / historical heritage and landscape scenic value. Hence, the pre-dominant land-use in these environments is usually non-consumptive and mainly in the form of tourism. However, tourism may have not proven to be most economically rewarding land-use option given the prolonged effects of natural disasters and pandemics. This has created an uncertainty which resulted in community in town looking beyond conservation for alternative income streams and thus increased mining activities are observed in communal conservancies.

In case of social impacts, the assessment focused on third parties only (third parties include members of the public and other local and regional institutions) and did not assess health and safety impacts on workers because the assumption was made that these aspects are separately regulated by health and safety legislation, policies and standards.

The No-Action Alternative comparative assessment, suggests that environmental impacts of a future in which the proposed activities do not take place, may be good for the receiving environment because there will be no potential negative or positive environmental impacts associated with the proposed activities (mineral prospecting).

5.2 ASSESSMENT OF IMPACTS AND MITIGATION

Mitigation measures to address the identified impacts are discussed in this section and included in more detail in the EERP report that is attached in **Appendix B.** In most cases (unless otherwise stated), these mitigation measures have been taken into account in the assessment of the significance of the mitigated impacts only

5.2.1 IMPACTS ON THE BIOPHYSICAL ENVIRONMENT

Potential impacts in respect to the Biophysical environments (**Table 6 - 8**) involves, given that the proposed activity entails non-invasive and consumptive mining development activities but rather limited to prospecting presents mainly secondary potential impacts. Geological surveys and rock sampling, and desktop research creates opportunity for the project staff members to access otherwise reserved park areas and thus temptations for poaching and collection of natural resources. Details of the potential impacts are demonstrated in the following tables:

Table 7. Impact on the Biophysical Environment – Mining claims site Access and use of vehicles

Impact Event	Disturba	nces on Biod	liversity					
Description	Off-road driving is a major concern, particularly with regard to uncontrolled use of 4x4 vehicles and quad-bikes. This leads to physical degradation and the destruction of unique habitats, especially of highly fragile lichen fields and breeding areas of endangered species, such as Damara Terns.							
Nature	of the d the area to increa	Tracks leave scars that can remain for centuries, affecting the aesthetic qualities of the dunes and the surrounding gravel plains, reducing the attractiveness of the area as a recreational destination. Littering of the beaches and the desert due to increasing tourism is a general problem. Camping outside of designated areas occurs during peak holiday periods.

	L	L	L	L	L	L	
Conceptual Description of Mitigation Measures	 Given that lodging is recommended to be at existing camp-sites and or lodges, this aspect shall be managed as part of the current property owners compliance requirements In the field, hydrocarbon waste shall be contained (in spill kits) and stored in appropriate heavy-duty plastic cabbage, transported to the nearest waste-oil recycling / solid waste disposal facility in Henties Bay or Swakopmund A sufficient number of spill kits shall be acquired and strategically placed, particularly near every sampling site to ensure that timely response to any potential fuel and lubricant spills is conducted (should the project require any sampling activities to be undertaken). These shall include an on-site used oil disposal bin(s) Equally, effluent waste shall be managed in compliance with the lodging host's requirements, although during any sampling activities – temporary dry-pit toilet facility must be provided at every site. 						

5.2.2 IMPACTS ON THE SOCIO-ECONOMIC ENVIRONMENT

Table 10. Environmental Impact: Human Health and Safety

Impact Event	Disturba	nces to the s	ocial envir	onments					
	During the exploration stage, social impacts are most likely to be minimal and often positive. At this stage, usually the level of interaction between project staff and or project equipment with the local community is significantly minimum and therefore potential health and safety risks very low. However, given the Corvid-								
Description	through	19 pandemic it is recommended that all protocol in this respect are observed throughout the exploration phase. The inter-migration of project staff in-and-out of the region may present							
Nature	potential risks of disease transmission particularly in respect to Corvid-19 and other contagious diseases between the local community and project staff. The most significant impact in respect to health is the potential for increasing the strain on the already under capacitated local health services facility should

Mitigated	Severity	Duration	Spatia Scale		Consequence	Probab Occur	pility of rence	Significance
Conceptual Description of Mitigation Measures	 Strict compliance with the EMP is recommended in respect to managing incidental events; Noise complaint register must be kept and maintained regularly with mitigation measures adopted accordingly. All excessive noise generating activities must be strictly carried out during the day between o8hoo (am) and 17hoo (pm) week days only. Conditions of the Environmental Clearance Certificate and Surface-use Agreement (with the relevant Traditional Authority and Park) must be accordingly adhere to. As much as possible, it is recommended that vehicles with the most minimum footprint are used such as smallest excavator and or portable drill rig (drawn on a trailer). 							

Table 12. Impact on the Social Environment – Culture, Heritage and Scenic values

Impact Event	Disturba	nces to the h	eritage	and	d scenic value of	the en	vironment	
Description	The rapid on-ground survey and desktop review for cultural and heritage sites, reveals that generally there were low/no occurrence of known cultural heritage or archaeological sites, hence the assumption is that the occurrence of undiscovered sites within the claims area is low. However, evidence cultural heritage were observed at Cape Cross, Messum Crater which falls outside the boundaries of the proposed mining claims 69966 & 69967.							
Nature	previous have bee	Any sites that did exist here would either have been discovered already during previous investigations (due to the accessibility of the site to archaeologists) or have been destroyed during previous exploration and mining operations and or other land-uses such farming and tourism undertaken in the area.						
Phases: Phases during highlighted below;	which sources of social (cultural, heritage and scenic values) impacts apply are

Unmitigated	Severity L	Duration L	Spatial Scale		Consequence H		bility of Irrence L	Significance H
Mitigated	Severity	Duration L	Spatial Scale L		Consequence H		bility of Irrence L	Significance M
Conceptual Description of Mitigation Measures	 Strict compliance with the EMP is recommended in respect to managing incidental events Contractors working on the site should be made aware that under the National Heritage Act, 2004 (Act No. 27 of 2004) any items protected under the definition of heritage found in the course of development should be reported to the National Heritage Council The chance finds procedure as outlined in the EMP must be implemented at all times, and. Detailed field survey should be carried out if suspected archaeological resources or major natural cavities / shelters have been unearthed during the proposed exploration and test mining operations. A stakeholder complaint register must be kept and maintained regularly with mitigation measures adopted accordingly, recording all concerns relating impacts of the proposed exploration activities on the cultural and scenic value of the environment which may be reported by interested and affected parties.

6. CONCLUSIONS AND RECOMMENDATIONS

6.1 CONCLUSIONS

Namibia is an up-and-coming source country for critical minerals, which are important for renewable energy technologies. The country has the potential to develop new mining projects for cobalt and lithium, and therefore it has in recent years seen great interest towards the exploration and development of mineral commodities by foreign investor.

There are thus, many companies engaged in the exploration and mining activities for various metals / minerals including InterContinental Mining Namibia. This creates opportunities that attracts international investment to support increased exploration activities particularly with an interest in finding lithium. InterContinental Mining (Pty) Ltd, was presented an opportunity to undertaking an exploration programme in respect in respect to Base and Rare Metals, Dimension Stone, Industrial Minerals, Non-Nuclear Fuel Mineral and Precious Metals

While increased economic activities can stimulate demographic changes and alter social, economic and environmental practices in many ways. Adverse environmental and socio-economic impacts have become a major area of concern for the business community, their customers, and other key stakeholders. Therefore, to ensure that development activities are undertaken in an economic, social and environmental sound / sustainable manner, the Namibian Constitution and Environmental Management Act No. 7 of 2007 provides for an environmental assessment process.

A key consideration in respect to the proposed project alternatives, is that of mining claims location / site particularly considering that it falls within a park environment and in proximity to the Dorob National Park. Primarily, the key objective in respect to conservancies or national park is conservation of particularly wildlife, cultural / historical heritage and landscape scenic value. Hence, the pre-dominant land-use in these environments is usually non-consumptive and mainly in the form of tourism. However, tourism may have not proven to be most economically rewarding land-use option given the prolonged effects of natural disasters and pandemics. This has created an uncertainty which resulted in community in town looking beyond conservation for alternative income streams and thus increased mining activities are observed in communal conservancies.

In case of social impacts, the assessment focused on third parties only (third parties include members of the public and other local and regional institutions) and did not assess health and safety impacts on workers because the assumption was made that these aspects are separately regulated by health and safety legislation, policies and standards.

The No-Action Alternative comparative assessment, suggests that environmental impacts of a future in which the proposed activities do not take place, may be good for the receiving environment because there will be no potential negative or positive environmental impacts associated with the proposed activities (mineral prospecting).

Overall, potential impacts may vary in terms of scale (locality), magnitude and duration e.g. minor negative impacts in the form of visual intrusion, dust and noise pollution especially during the field-based activities i.e. sampling and or trenching.

Below is a summary of the likely positive impacts that have been assessed for the different phases of the proposed InterContinental Mining (Pty) Ltd's mineral prospecting activities:

- Socio-economic development and capacity building through partnering with foreign operators / investors, skills transfer and training on the mining development sector shall be achieved (Likely impacts are high).
- Creation of employment opportunities and strengthening /expansion of SME business
- Consequential Infrastructure development e.g. development of a Mine should viable deposit be discovered.

The following is a summary of the likely negative impacts that have been assessed for the different phases of the existing sand mining project:

- Ambient Air Quality and Noise Pollution (Likely impacts are Low).
- Ecological and biodiversity loss (Likely impacts are localized and low).
- Health and safety (Overall likely impacts are low with the adoption and compliance of appropriate mitigation measures).
- Accidental Spill of Hazardous substance (Likely impacts are low with proper implementation of the environmental management plan in place).
- Cultural Heritage, Archaeological and Scenic value (Likely impacts are low with proper implementation of the environmental management plan in place).

6.2 RECOMMENDATONS

Enviro-Leap environmental practitioner confidently recommends that the proposed project can proceed and should be authorized by the DEAF. The proposed operations is considered to have, overall low negative environmental impacts and potential for the enhancement of socio-economic benefits provided all protocols including the proposed mitigation measures are adhered to.

Based on this, it recommended that the proponent must upon obtaining their Environmental Clearance Certificate (ECC), implement all appropriate management and mitigation measures and monitoring requirements as stipulated in the Scoping Report and or as condition of the ECC. These measures must be undertaken to promote and uphold good practice environmental principles and adhere to relevant legislations by avoiding unacceptable impacts to the receiving environment.

6.3 STAKEHOLDER ENGAGEMENT AND MONITORING

It is important that channels of communication are maintained over the life-time of the proposed mineral prospecting project, and with all key stakeholders, members of the general public (including I&APs), as well as the local and traditional authorities, **Table 13** shows the stakeholders engagement recommendations.

Table 13: Actions relating to stakeholder communication

Issue	Management commitment	Phase
	On obtaining the Environmental Clearance Certificate and	
Development and	other relevant authorization it is recommended that the	
maintenance of a	proponent undertakes a stakeholder engagement process to	
Stakeholder engagement	develop a Communication and Monitoring Plan for	
plan	continuous reporting and feedback	All
	Maintain and update the stakeholder register, including stakeholders' needs and expectations. Ensure that all relevant stakeholder groups are included building on pre-identified and registered I&APs.	All
Understanding who the stakeholders are	A representative database would include all relevant local government, service providers and contractors, indigenous populations, local communities, Traditional Authorities (TAs), NGOs, shareholders, the investment sector, community-based organizations, suppliers and the media.	All
	Ensure that marginalized and vulnerable groups are also	7 (11

	and contribution to development.	All
Liaising with interested and	Devise and implement a stakeholder communication and	
affected parties at all phases	engagement strategy.	All
in the mine life		
	InterContinental Mining (Pty) Ltd and Enviro-Leap Consulting (On-	
Responsibility	contract)	

A stakeholder engagement plan is an important tool in ensuring that a good working relationship is maintained between the proponent and the community within which the activities are undertaken. It is crucial that this plan is developed in the same transparent manner and approach as the environmental assessment, and that it remains a living document which allows the stakeholder to engage with throughout the duration of the proposed activity.

Equally, it must be at all time readily available on request to all interested and affected parties for review and must provide clear procedures for how and where it can be accessed.

APPENDIX A: ENVIRONMENTALMANGEMENT PLAN

OVERALL OBJECTIVES OF THE EMP

The following overall environmental objectives have been set for the InterContinental Mining (Pty) Ltd exploration and mining development project:

- To comply with national legislation and standards for the protection of the environment.
- To limit potential impacts on biodiversity through the minimisation of the footprint (as far as practically possible) and the conservation of residual habitat within the mine area.
- To keep surrounding communities informed of farming activities through the implementation of forums for communication and constructive dialogue.
- To develop, implement and manage monitoring systems to ensure good environmental performance in respect of the following: ground and surface water, air quality, noise and vibration, biodiversity and rehabilitation.

KEEPING EMPS UP TO DATE

This Environmental Management Plan (EMP) document is designed to meet legal requirements and avoid or minimize the impacts associated with the implementation of InterContinental Mining (Pty) Ltd exploration and mining development. It is the intention that this EMP should be seen as a "living document" which will be amended during the operation, as the activities might change or new ones be introduced.

Should a listed activity(s) as defined in the Environmental Impact Assessment Regulations: Environmental Management Act, 2007 (Government Gazette No. 4878) be triggered (as a result of future modifications/changes at the mine), this EMP will be updated as a result of another EIA process as stipulated in the regulations.

IMPACTS MANAGEMENT / MITIGATION MEASURES

Table 14. Impact on the Biophysical Environment – mining claims site Access and use of vehicles

Issue	Management commitment	Phase
Understanding who the stakeholders are	 Maintain and update the stakeholder register, including stakeholders' needs and expectations. A representative database would include all relevant local government, service providers, indigenous populations, Traditional Authorities (TAs), NGOs or community-based organizations Ensure that marginalized and vulnerable groups are also considered in the stakeholder communication process. Record partnerships as well as their roles, responsibilities, capacity and contribution to development. 	
Liaising with interested and affected parties at all phases in the mine life	Devise and implement a stakeholder communication and engagement strategy.	All
Responsibility	InterContinental Mining (Pty) Ltd and Enviro-Leap Consulting (On contract by	oasis)

Table 15. Impact on the Biophysical Environment – Mining Claims site Access and use of vehicles

Impact Event	Disturbances on Biodiversity in respect to access tracks	
Desired mitigation outcome	The objective of the mitigation in respect to impacts on biodiversity is to that as much as possible, disturbance on biodiversity is avoided and pre while the proposed prospecting activities is undertaken.	
Proposed Mitigation Measures	 Strict compliance with the Park Management guidelines and EMP is recommended in respect to managing incidental events; Exploration activity must be limited to the pre-identified pegmatites belts within the claims area Unless necessary and agreed with the park management, no new access tracks shall be created and no lodging shall be allowed in sensitive zones 	All
Responsibility	InterContinental Mining (Pty) Ltd and Enviro-Leap Consulting (On contract l	basis)

Table 16. Impact on the Biophysical Environment – Bulk sampling and ore extraction

Impact Event	Disturbances on Biodiversity in respect to sampling and trenching activ	ities
Desired mitigation outcome	The objective of the mitigation in respect to impacts on biodiversity is to that as much as possible, disturbance particularly on wildlife (poaching flora (clearing / damage) species is reduced and or prevented.	
Proposed Mitigation Measures	 Strict compliance with the Forestry Act and Regulations in respect to vegetation clearing, Park Management guidelines and EMP is recommended in respect to managing incidental events; Should the proponent require clearing, removal and transplantation of any protected plant species – services of an appropriately qualified botanist / ecologists must be sought and relevant permissions obtained prior to any such activity being undertaken A plant survey must be conducted and all protected species clearly marked and protected prior to setting-up any sampling site and or digging any trench for geological sampling Exploration activity must be limited to the pre-identified pegmatites belts within the claims area thus reducing the spatial impacts to key areas of the mining claims Unless necessary and agreed with the park management, no new access tracks shall be created and no lodging shall be allowed in sensitive zones Temporary bins and spill kits must be provided to ensure that all waste material including hydrocarbons are well contained prior to final disposal at approved sites in either Henties Bay or Swakopmund. Unless in an emergency, no equipment (vehicles and drill rigs) should be serviced in the field thus preventing unnecessary spillage of hydrocarbons 	All
Responsibility	InterContinental Mining (Pty) Ltd and Enviro-Leap Consulting (On contract	basis)

5.2.2 IMPACTS ON THE SOCIO-ECONOMIC ENVIRONMENT

Table 8. Impact on the Biophysical Environment – Waste Management (Effluent, Solid and Hydrocarbons)

Impact Event	Waste generation and disposal	Phase
Desired mitigation outcome	The objective of the mitigation in respect to waste generation is to ensithe best scenic value and integrity of the affected environment mainta or enhanced by reducing chances of littering through proper use of management facilities.	ined and
Proposed Mitigation Measures	 Environmental awareness is an important aspect of environmental management, therefore all project staff and service providers must be educated of the environmental compliance requirements and urged to comply accordingly on induction to the project site. Given that lodging is recommended to be at existing camp-sites and or lodges, this aspect shall be managed as part of the current property owners compliance requirements In the field, hydrocarbon waste shall be contained (in spill kits) and stored in appropriate heavy-duty plastic cabbage, transported to the nearest waste-oil recycling / solid waste disposal facility in Uis or Omaruru A sufficient number of spill kits shall be acquired and strategically placed, particularly near every sampling site to ensure that timely response to any potential fuel and lubricant spills is conducted (should the project require any sampling activities to be undertaken). These shall include an on-site used oil disposal bin(s) Equally, effluent waste shall be managed in compliance with the lodging host's requirements, although during any sampling activities – temporary dry-pit toilet facility must be provided at every site. 	All
Responsibility	InterContinental Mining (Pty) Ltd and Enviro-Leap Consulting (On contra-	ct basis)

Table 9. Environmental Impact: Human Health and Safety

Impact Event	Prevention and mitigation of any health and safety hazards / risks	Phase
Desired mitigation outcome	The objective of the mitigation in respect to health and safety haza ensure that the health, safety and protection of both the project s community receive priority in terms of budgetary provision and compliant	taff and
Proposed Mitigation Measures	 Strict compliance with the EMP is recommended in respect to managing incidental events; It is strictly advised that project staff ensures that in respect to Corvid-19, are tested prior to venturing in the field (and carries a health certificate indicating a negative result, which is not older than 72 hours) Carry sufficient First Aid equipment to ensure that minor injuries reduces need to access local health facility and therefore minimizing potential strain on local services Strict compliance with national health protocols as and when directive are issued in respect to any disease outbreak and or recurring pandemics such as HIV / AIDS and Corvid-19 Strict ban on use of any toxic substances within and during the working environment must be prohibited and serious punitive actions taken against any transgressors is recommended. 	All
Responsibility	InterContinental Mining (Pty) Ltd and Enviro-Leap Consulting (On contra	ict basis)

Table 10. Impact on the Social Environment – Air and Noise Pollution

Impact Event	Disturbances to the social environment	Phase
Desired mitigation outcome	The objective of the mitigation in respect to ambient air quality and sens / noise nuisance is to ensure that all possible receptors are identified and measures are put in place to reduce these impacts and or resp appropriate mitigation to complaints	l practical
	Strict compliance with the EMP is recommended in respect to	
	managing incidental events;	
Proposed Mitigation Measures	 Noise complaint register must be kept and maintained regularly with mitigation measures adopted accordingly. All excessive noise generating activities must be strictly carried out during the day between o8hoo (am) and 17hoo (pm) week days only. Conditions of the Environmental Clearance Certificate and Surfaceuse Agreement (with the relevant Traditional Authority and Town) must be accordingly adhere to. 	
	As much as possible, it is recommended that vehicles with the most	
	minimum footprint are used such as smallest excavator and or portable drill rig (drawn on a trailer).	
	InterContinental Mining (Pty) Ltd and Enviro-Leap Consulting (On	contract
Responsibility	basis)	

Table 11. Impact on the Social Environment – Culture, Heritage and Scenic values

Impact Event	Disturbances to the heritage and scenic value of the environment Phase			
Desired mitigation outcome	The objective of the mitigation in respect to impacts on cultural and archaeological heritage integrity is to ensure that at all times, project staff are vigilant of the potential to intrude, disturb and or damage important artifacts and therefore must avoid wondering onto any protected and or sensitive known or identified site.			
Proposed Mitigation Measures	 Strict compliance with the EMP is recommended in respect to managing incidental events Contractors working on the site should be made aware that under the National Heritage Act, 2004 (Act No. 27 of 2004) any items protected under the definition of heritage found in the course of development should be reported to the National Heritage Council The chance finds procedure as outlined in the EMP must be implemented at all times, and. Detailed field survey should be carried out if suspected archaeological resources or major natural cavities / shelters have been unearthed during the proposed exploration and test mining operations. 			
Responsibility	InterContinental Mining (Pty) Ltd and Enviro-Leap Consulting (On contract basis)			

Table 12. Impact on the Economic Aspect

Impact Event	Disturbances on social and economic aspects	Phase
Desired mitigation outcome	The objective of the mitigation in respect to economic impacts relating proposed activity, is to ensure that potential negative economic impacts and existing land-use are prevented, reduced and or mitigated and thones enhanced.	s on other
Proposed Mitigation Measures	 It is critical that timely and continuous communication and dissemination of information with the local community is ensured to alleviate potential sense of social marginalization, drive gender equality and enhance the understanding and perception of the benefits associated with InterContinental Mining (Pty) Ltd's activities To enhance the positive impacts relating to marginal net benefits for the micro-economy (local residence of Cape Cross and the region at large) and national economy at larger, legislative provisions to Affirmative Action and Labour Welfare must be observed It is strictly recommended that InterContinental Mining (Pty) Ltd negotiates and signs a Surface Use Agreement detailing aspects of conduct and benefit distribution with all key stakeholder i.e. Traditional Authority, Park and other Operators or support institutions e.g. NGOs / CSOs) 	All
Responsibility	InterContinental Mining (Pty) Ltd and Enviro-Leap Consulting (On contract basis)	

Table 13. Site Closure and Rehabilitation

Impact Event	Disturbances on social and economic aspects	Phase	
Desired mitigation outcome	The Proponent will commit to establishing a rehabilitation plan as part of the mine closure plan. A conceptual mine closure plan with costing is under development must be compiled by InterContinental Mining in association with Enviro-Leap and forms part of the environmental compliance and monitoring programme.		
Proposed Mitigation Measures	 InterContinental Mining (Pty) Ltd shall submit regular (bi-annual or annual Environmental Reports) to the relevant Ministry stating the exploration activities and environmental performance of the project. Staff of the MET or Ministry of Mines and Energy may at any time inspect the exploration area. Internal and external monitoring should involve InterContinental Mining's safety and environmental officer and members of the MEFT. Should the decision be taken that the project is not economically viable the area will be rehabilitated. The rehabilitation measures that are set out in the Rehabilitation Plan (to be compiled and approved by MEFT) are binding to all personnel on site including the crew and contractors. 	Closure	
Responsibility	InterContinental Mining (Pty) Ltd and Enviro-Leap Consulting (Orbasis)	n contract	

APPENDIX B: PUBLIC CONSULTATION

CONFIDENTE Litting the list Page 19 01 April - 07 April 2022

PUBLIC NOTICE

Notice is hereby given that Nghiyelwa Planning Consultants (Town and Regional Planners) on behalf of the owners of Erf 2252, Kilimanjaro Street, Windhoek, intends applying to the Windhoek Municipal Council and the Urban and Regional Planning Board for

e: Rezoning of Erf 2252, KilimanjaroStreet, Windhoek from "Residential" with a density of 1:900 to "Business" with a bulk of 0.4:

with a bulk of 0.4; Erf 2252, is located in Kilimanjaro Street, Windhoek and currently measure 1022 m² in extent. The erf is currently zoned for "Residential" with a density of 1:900. It is the intent of the owners to rezone Erf 2252, Klimanjaro Street, Windhoek from "Residential" with a density of 1:900 to "Business" with a bulk of 0.4. This will allow the owner to construct a business and office building on the rezoned property.

Should this application be successful, the number of vehicles for which parking must be provided on-site will be in accordance with the Windhoek Zoning Scheme.

The locality plans of the Erf lie for

inspection on the town planning notice board of the Windhoek Municipality: Customer Care Centre, Main Municipal Offices, Rev. Michael Scott Street, Windhoek and the Applicant: Scripture Union Building, Ara Street, Windhoek,

Any person objecting to the proposed Any person objecting to the proposed use of the land as set out above may lodge such objection together with the grounds thereof, with the Windhoek Municipality and with the applicant (Nghivelwa Planning sultants) in writing within 14 days e last publication of this notice.

The last date for any objections is: 15 April 2022

Applicant: Nghiyelwa Planning Consultants P O Box 40900, Ausspannplatz

Email: p Tel: 081 289 897

CALL FOR PUBLIC PARTICIPATION

ENVIRONMENTAL IMPACT ASSESSMENT FOR PROPOSED MINERAL PROSPECTING AND EXPLORATION, EPL 8397, ERONGO REGION

This notice serves to inform interested and affected parties that an application for the environmental clearance certificate will be launched with the environmental commissioner in terms of the Environmental Impact Assessment Management Act (No. 70 (2007) and Environmental Regulations (GN 30 of 6 February 2012) for the proposed activity:

Project: Proposed mineral prospecting and exploration

Location: The project is located in Erongo Region, approximately 23 km vest of the town of Uis. EPL 8397 covers state land and EPL's northern portion covers Okombahe Reserve.

Project description

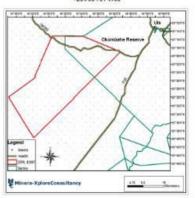

iral prospecting and exploration on EPL 8397

Orange River Exploration and Mining CC nental Assessment Practitioner (EAP): nera Xplore Consultancy CC

dance with Namibia's Environmental Management Act (No. 7 of 2007) and Environmental Regulations (GN 30 of 6 February 2012), all interested and affected parties (&APs) are invited to register and submit mments, concerns and questions in writing to the emails given below on or before 25/04/2022

ENVIRONMENTAL ASSESSMENT FOR THE PROPOSED **EXPLORATION ACTIVITIES IN RESPECT TO BASE AND RARE** METALS (LITHIUM), AND OTHER MINERAL'S ON (MC 69966 & & 7) NEAR THE UIS SETTLEMENT, ERONGO REGION

1. PROJECT SITE AND DESCRIPTION

InterContinental Mining (Pty) Ltd, intends to apply in order to obtain an Environmental Clearance Certificate for its proposed Base and Rare and Metals and other Mineral's for Mining Claim (MC 69966 & 7). The key component of the proposed activity entails small-scale Lithium mining operations

2. PUBLIC PARTICIPATION PROCES

Enviro-Leap Consulting invites all Interested and Affected Party (I & AP) register and receive Environmental Assessment (BID, Scoping and EMP) documents relating to the proposed project for their comments and input.

3. COMMENTS AND QUERIES Interested and Affected Parties are further requested to register by writing to us at the address below no later than 02 May 2022.

Please register and direct all comments, gueries to: Mr. Viho Mtuleni, Environmental Assessment Practitione Email: eap.trigen@gmail.com - Cell: +26481 232 6843

ENVIRONMENTAL ASSESSMENT FOR THE PROPOSED EXPLORATION ACTIVITIES IN RESPECT TO BASE AND RARE METALS AND OTHER MINERALS IN THE AREA OF INTEREST (MC 71556-8) ON EPL 8220, ERONGO REGION

1. PROJECT SITE AND DESCRIPTION

Intercontinental Mining (Pty) Ltd, intends to apply in order to obtain an Environmental Clearance Certificate for its proposed prospecting of Base and Rare and Metals and other Mineral's on (MC 71556-8) within EPL 8220. The key component of the proposed activity entails geological mapping and surveying, and manual sample collection for laboratory analysis.

2. PUBLIC PARTICIPATION PROCESS

2. PUBLIC PARTICIPATION PROCESS

Enviro-Leap Consulting invites all Interested and Affected Party
(1 & AP) to register and receive Environmental Assessment (BID, Scoping and EMP) documents relating to the proposed project

scoping and every occuments relating to the proposed project for their comments and injury. AND QUERIES Interested and Affected Parties are further requested to register by writing to us at the address below no later than 02.

DRESSED-IN-TIME

NOTICE OF ENVIRONMENTAL ASSESSMENT PROCESS PROPOSED CONSTRUCTION AND OPERATION OF A DRICK FACTORY IN OBLIAKATI, OBLIANA REGION

GCS Water Environmental Engineering Namibia (Pty) Ltd (GCS) hereby give notice to all potentially interested and Affected Parties (I&APs) that an application will be made to the Environmental Commissioner in terms of the Environmental Management Act (No 7 of 2007) and the Environmental Impact Assessment Regulations (GN 30 of 6 February 2012) for the following:

Construction and operation of a proposed brick factory in Oshakati, Oshana Region.

The Proponent: Sanli Construction CC Environmental Assessment Practitioner (EAP): GCS Water Environmental Engineering Namibia (Pty) Ltd

GCS has been appointed to conduct the process and submit the application to the Environmental Commissioner on behalf of the proponent.

REGISTRATION OF I&APs AND SUBMISSION OF COMMENTS: To comment or receive further information on the project,

please register with GCS (contact details below) as an I&AP before or on 22 April 2022.

All registered (&APs will be informed of possible consultation meetings to be held as necessary

>> Supply disruptions

OPEC has no control over global oil markets

exporter of crude and fuel, shipping around 7 million bod or 7% of global supplies.

MARIANNA PARRAGA

PEC has no control over the events that have led to the run up in global oil prices and there is not enough capacity worldwide to compensate for the loss of Russian supply, OPEC Secretary General Mohammad Barkindo

said on Monday. Benchmark Brent crude prices surged on Monday, touching a 14-year high of over US\$139 a barrel as the United States and European allies considered banning Russian oil imports following Russia's invasion of Ukraine.

Russia is the world's top exporter of crude and fuel, shipping around 7 million bpdor 7% of global supplies.

"There is no capacity in the world that could replace 7 millions barrels per day," Barkindo told reporters at

an industry conference in Houston. "We have no control over current events, geopolitics, and this is dictating the pace of the market," he

ments exempted energy trade from sanctions to prevent already tight markets rallying further, but that has failed.

Traders have avoided Russian oil to avoid running afoul of future sanctions or unwittingly violating sanctions already imposed on Russian banks, companies and individuals

With an outright ban, some an-alysts posit prices could rocket even higher. JPMorgan predicted Brent could hit US\$185 by year-end. A supply shortage would require

prices to rise enough to cut demand.
"I have heard from several speakers here at CERAweekthat current tightness in the market condition might be creating some demand de-struction," said Barkindo.

"Even as that might be the case, the other side of the equation is probably more critical at the moment, which is supply is increas-ingly lagging behind."

Restrictions

When asked why the Organization of the Petroleum Exporting Coun-tries (OPEC) and its allies did not just end all restrictions on output at their meeting last week, Barkin-do told Reuters the situation in oil markets had developed since the group met on March 2.

meeting," he said.

op EC and allies led by Russia, a group known as OPEC, said after that meeting in a statement that markets were well balanced, and OPEC sources reaffirmed that earlier on Monday.

OPEC remained committed to market stability, Barkindo said. The group continued to unwind the deep cuts imposed at the height of the pandemic, he said. Production should be fully restored from the cuts in September, he said. OPEC stuck to a plan for a modest

output rise in April at the March 2 meet and ignored the Ukraine crisis in their talks.

The situation in the markets was likely to be a game-changer in the energy transition, Barkindo told reporters.

Access to capital for the oil indus-try has become more challenging, he said, but the crisis was showing the world could not afford to stop investing in oil and gas. Most OPEC members have little

spare oil production capacity at the moment, with the bulk of the extra capacity available in the Gulf states of Saudi Arabia and the Unite dArab Emirates, according to the International Energy Agency.

Moderna announces vaccine facility in Kenya

US vaccine maker Moderna announced Monday that it would build its first mRNA jab-manufacturing facility in Africa after signing an agreement with Kenya's government to produce up to

500 million doses a year.

The company said it expected to invest US\$500 million in the new facility, which will produce vaccines for the continent of 1.3 billion people whose population has been largely shut out of

access to Covid jabs. "Battling the Covid-19 pandemic over the last two years has provided a re-minder of the work that must be done minder of the work that must be done to ensure global health equity. Moderna is committed to being a part of the so-lution," the company's CEO Stephane Bancel said in a statement. Moderna said it hopes to use the facil

ity to supply doses of its Covid-19 jab to African nations as early as next year, in a bid to boost vaccine coverage on the world's least immunised continent.

"Moderna's investment in Kenya will help advance equitable global vaccine access and is emblematic of the structural developments that will enable Africa to become an engine of sustain-able global growth," Kenya's President

Uhuru Kenyatta said.

More than a year after the world's first Covid-19 shot was administered and two years into the pandemic itself, just 12.7 percent of Africans have been fully immunised, according to the Africa Centres for Disease Control and Pre vention (CDC).

Imports

The pandemic has exposed Africa's huge dependence on imported vaccine and its tech weakness compared with Europe, China and the United States.

Moderna's announcement follows: decision by the World Health Organi-zation to create a global mRNA vaccine hub in South Africa last year, with Kenya among six African nations selected to be the first recipients of technology aimed at enabling local manufacturers

to make jabs. WHO chief Tedros Adhanom Ghebreyesus has repeatedly called for eq-uitable access to vaccines in order to beat the pandemic, and attacked wealthy nations for hogging doses.

Currently only one percent of the vac-cines used in Africa are produced on the continent.

African and other developing nations are pushing at the World Trade Organization for a temporary intellectual property waiver to allow the generic production of Covid-19 vaccines and treatments.

Europe, the home of some of the major companies behind the vaccines has opposed the move, arguing that the first priority was to build up production capacity in poorer countries.
