National Demographic Sample Survey, incorporating Mid-Decade Goal Survey (September 1996)

PREFACE

The National Planning Commission (NPC), in collaboration with the Ministry of Health and Social Services, conducted a national Demographic Sample Survey, incorporating Mid-Decade Goal Survey in September 1996. The 1996 NIDS was therefore combined with the Mid-Decade Goals Survey (the MIDGS).

The main objectives of the 1996 NIDS were, in the first place, to provide basic data required for policy making at national and regional levels as well as for different sectors. Secondly, the survey results would facilitate determination of needs or the establishment of targets. The 1996 Namibia Intercensal Demographic Survey Incorporating the Mid-Decade Goals Survey was identified as a means to collect information on population characteristics which would be used to measure the development of the Namibian population. Ten thousand households were selected to participate in this survey.

Apart from updating the data from the 1991 Census of Population and Housing, the data from the NIDS, for the first time, provide a basis for analyzing regional migration rates. These rates are needed in order to project population by region.

At the World Summit for Children in 1990 heads of state and government and senior officials from around the world pledged themselves to a Declaration and Plan of Actions for Children. The Government of the Republic of Namibia is committed to the attainment of *Health For All Namibians By the Year 2000 and Beyond*. It is against this background that the Government, through the Ministry of Health and Social Services, places a high priority emphasis on the need to have up-to-date and reliable statistics on the health and welfare of women and children in Namibia, to facilitate development planning.

The Mid-Decade Goal Survey was therefore conducted to measure progress towards the achievement of the Mid-Decade Goals (MDG) by various sectors supported by UNICLIJ at national and sub-national levels. In addition, the survey was conducted to determine the level of sustainability of the programmes and to evaluate the degree of community involvement and participation in the programmes.

This report contains the basic Tables, based on tabulation of responses to questions asked during the integrated survey. For those whose interest goes beyond the basic Tables, the Central Bureau of Statistics can be approached to provide additional tabulations. It is hoped that the volume will meet the needs of planners, researchers and the general public.

Saarah Knuongelwa

National Demographic Sample Survey, incorporating Mid-Decade Goal Survey (September 1996)

1. Introduction

The integrated survey was conducted nation-wide, based on a representative sample of 10,000 households, covering the thirteen regions, rural and urban areas and different population groups. The survey work started on 1 September 1997 and lasted two weeks.

2. Objectives of the Survey

The 1996 NIDS was combined with the Mid-Decade Goals Survey (the MDGS). The main objectives of the 1996 NIDS were, in the first place, to provide basic data required for policy making at national and regional levels as well as for different sectors. Secondly, the survey was designed to facilitate determination of needs or the establishment of targets. The survey was also designed for the following purposes:

- to serve as an evaluation study of the 1991 census;
- to serve as a pilot survey for the 2001 census;
- to give statistics on population and on the demographic and social-demographic development for administrative planning and research;
- to give information on population and related factors of specific interest for planning and research;
- Provide an adequate statistical basis for overall social and economic planning;
- Provide an adequate statistical basis for measuring the size growth and for determining the structure and composition of the population by age, sex, region, etc.;
- Make it possible to estimate basic demographic characteristics such as births, deaths, marriages, divorces and migration;
- Provide an adequate statistical basis/platform for the analysis of national and regional demographic data;
- Make it possible to estimate future population trends through population projections and;
- Serve as data-source for up-dating of the Namibian Master Sample.

The MDGS was conducted to meet the following objectives:

- To measure progress towards the achievement of the Mid-Decade Goals (MDG) by various sectors supported by UNICEF at national and sub-national levels;
- To determine the level of sustainability of the programmes and to evaluate the degree of community involvement and participation in the programmes;
- To collect baseline data for the End-Decade-Goals and;
- To measure knowledge, attitudes and practice of the target population about the programmes being evaluated.

3 Legal Provisions

The Statistical Act 66 of 1976 entrusts the Central Statistics Office (CSO), now Central Bureau of Statistics (CBS), with the legal power to authorize Population Censuses and Surveys as the need arises to collect statistical information on the Namibian population.

The Act empowers CBS' representatives - the interviewers - to enter the houses of selected households at reasonable hours for the collection of required information. It is demanded from the interviewers not to reveal or discuss any information collected with unauthorised persons. To ensure this secrecy all the interviewers and survey staff are required to take the oath of secrecy. Thus all the information will be treated with confidentiality. The law stipulates penalties for the contravention of any of the provisions of the regulation.

4. Problems Encountered and Solution

After the data entry and cleaning activities were completed in the Central Bureau of Statistics (CBS), analysis of the survey data was delayed for about six months due to technical reasons. By mid-November 1997, the CBS set up an Analysis Committee to effect the analysis of the survey data. One of the tasks of the Committee was to ascertain that the data collected were, in the first instance, of good quality.

During the course of analyzing the results of the 1996 Inter-Censal Demographic Sample Survey (16 Nov. 1997 to 20 Jan. 1998), the Analysis Team discovered some inconsistencies in the records of female respondents, particularly on their childbearing experience

and history of child mortality. Analysis of the data on fertility and mortality revealed levels and patterns which are questionable and difficult to justify.

The Team considered the demographic significance of these two variables; they provide the basis for the projection of total and regional populations. It was therefore suggested that a quick response-validity check, based on 15% of the 205 Primary Selection Units (PSUs) in the 1996 Survey Sample might be cost-effective, as this would provide a reasonable basis for making any adjustments to the obviously defective data on fertility and child mortality already collected. All females 15-49 (child-bearing ages) in the sub-sample who were covered in 1996 were re-visited. Their responses to the same questions were then matched. The results of the validity check were used to adjust the observed inconsistencies in the main survey data.

B1: Age distribution by agegroup and sex, 1991 and 1996
