

NAMIBIA LABOUR FORCE SURVEY 2008

(NLFS 2008)

MINISTRY OF LABOUR AND SOCIAL WELFARE

Directorate of Labour Market Services

REPORT OF ANALYSIS

ISBN.: 978-0-86976-798-6

T

he government believes that the immediate prospect of raising income levels among the majority of the population depends on its capacity and ability to execute sound employment planning within the overall framework of national development programme.

Namibia conducted its fifth post-Independence national labour force survey in 2008. This survey, known as the Namibia Labour Force Survey 2008 (NLFS 2008), provides a wealth of information on the state of labour force in the country that is by far superior in scope and quality to any that has been available previously, in particular that it incorporated a detailed module on Informal sector and Informal employment. A separate report on the characteristics of the informal sector will be published separately. There is no doubt that the planning process in Namibia will benefit immensely from a thorough analysis of this survey. This Report provides the final results of the analysis.

The 2008 Namibia Labour Force Survey was conducted to generate all the necessary information that would provide Government with the statistical data for analysis of employment, unemployment and underemployment and hence assist in formulating well-conceived policies designed to achieve full employment and promote socio-economic development in general. The report provides a wide range of information on population size and composition, employment and unemployment and other socio-economic characteristics of the workforce.

The findings of the survey provide important statistical base for strategic policy formulation. Apart from informing the public about the state of employment in Namibia, the survey results and in particular the unemployment rate should provide a basis for the evaluation and analysis of the macro-economic policies of the country. The results will also be essential in the design and evaluation of overall government policies aimed at promoting and creating employment.

It is hoped that policy makers, scholars, researchers and employers would find the information useful in their search for concrete solutions to our socio-economic and development problems.

The Ministry of Labour wishes to express its profound appreciation to the Central Bureau of Statistics of the National Planning Commission for its technical assistance, social partners, users of labour statistics and other collaborating ministries for their meaningful contributions.

The Ministry equally wishes to thank the Ministry of Labour' staff who were involved in all the activities; the general public who provided the much needed information; the interviewers, who tirelessly throughout the entire period; and all those without whose support and co-operation the 2008 Namibia Labour Force Survey would not have been a successful reality.

IMMANUEL NGATJIZEKO, MP

Honourable Minister of Labour and Social Welfare

March 2010

Executive Summary of the Report

1. Spatial Distribution of the population

The Namibia Labour Force Survey (NLFS) 2008 collected information on population residing in private households. However, population residing in institutional households which are in army and police barracks, nurses and prisons were not covered. A total of 1,789, 933 persons in private households were enumerated. Out of this number, 1,161,917 reside in rural areas. Khomas region recorded the highest number of population with 15.9 percent of the total population.

2. Sex ratio

The survey findings show a sex ratio of 90.2, meaning that there are 90 males per 100 females, which indicates that there are more females than males in Namibia. About 940,844 females as compared to 849,163 males were recorded during the NLFS 2008. Regionally, sex ratio differs from one region to the other in terms of having more females than males, or showing an equal sex representation.

3. Age distribution

- 3.1 Age is an important factor in demographic analysis as it is closely related to demographic and social processes. Migration turns to be age selective resulting from school going population and labour force which shows concentration in specific age groups. Namibia has a young population which is demonstrated by the broad base pyramid (Figure 3.2), which means that ages 0 19 are dominant.
- 3.2 Age dependency ratio is the ratio of children aged 00-14 and persons aged 65 and above per 100 persons in the working age population (15-64). Namibia has a dependency ratio of 81.8, meaning that for every 100 persons in the working age group (economically active), there are 81.8 dependents. The findings reveal that dependency ratio is high in rural areas as compared to urban areas. There is a slight decrease in overall dependency ratio from 83.5 in 2004 to 81.8 in 2008.

4. Educational profile of the population 6 years & above

Education refers to the skills and knowledge acquired through established schooling system. Education acquired determines the quality and type of human resources the country has in terms of skills and knowledge. The NLFS 2008 collected information on the highest level of education achieved. The findings reveal that 13.6 percent of the population has no education, while 45.3 and 1.2 percent completed primary and university education respectively. A small proportion (0.7 percent) has completed post graduate education. A large proportion of the population with no education is mostly found in rural areas, while those with secondary and university education are mainly in urban areas.

5. Type of housing units

- 5.1 The definitions of types of housing units are attached as appendix 1 Glossary. The NLFS 2008 findings reveal that traditional dwellings are the most common housing units (45.6 percent), followed by detached house (25.9 percent). The least dominant type of housing units in Namibia are guest flats and commercial/industrial (0.1 and 0.2 percent) respectively.
- The most common housing units in urban areas are detached houses (46.3 percent), while in rural areas, detached housing units have the percentage of 11.7 each with semi detached housing units. Furthermore, the survey reveals that about 68.8 percent of the households live in dwelling units that are owner occupied (without mortgage), while only 12.0 percent of the households live in dwelling units that are owner occupied (without mortgage).

6. Main source of income

6.1 The largest proportion of households (41.8 percent) in Namibia depends on wages and salaries as their main source of income, followed by subsistence farming (crops and animals) with 22.4

percent. Most of the households in rural areas depend on subsistence farming (37.3 percent) as their main source of income, while in urban areas wages and salaries (68.8 percent) remain the main source of income for most households.

6.2 The majority of households in Namibia (72.4 percent) do not have secondary source of income. However, 6.5 percent of households reported that cash remittances are their secondary source of income. In rural areas, 8.1 percent of households depend on subsistence farming (crop and animals) as their secondary source of income, while in urban areas, 4.2 percent of households survive on cash remittances.

7. Grants/Pension

In rural areas, about 78.5 percent of household persons reported that they receive grant/pension, while only 21.5 percent of household persons receive grant/pension in urban areas. Furthermore, it was revealed that about 71.4 percent of rural households are expecting to receive grant/pension, while 28.6 percent household persons in urban areas indicated to receive. The population of Namibia is rural based, therefore, all the three categories (receive, expect to receive & do not receive) are dominant in rural areas.

8. Economic activity of the population

- The NLFS 2008 recorded a total of 1,106,854 persons aged 15 years and above. Out of this number, 678,680 persons are economically active (employed and unemployed), while 428,173 are economically inactive. Among the economically active, 331,444 persons are employed and 347, 237 persons are unemployed.
- The employed males (186,093) outnumber their female (145,351) counterparts. Out of 331,444 employed persons, 208,075 resides in urban areas, where as only 123,369 are in rural areas.
- 8.3 The activity status of the working age population reveals that the current economically active population (15 yrs & above) is 55.4 percent. About 61.3 percent of the working age population is in the Labour Force.
- 8.4 Unemployment rate is the proportion of the unemployed persons in the Labour Force, which is currently at 51.2 and 37.6 percent respectively using the broad and strict measures. The two measures differ on whether an unemployed person was actively looking for work or not. The NLFS 2008 recorded 347,237 unemployed persons when a broad measure is applied and 199,570 unemployed persons with a strict measure.
- 8.5 Despite the fact that females are more than males in the working age population (1,106,854), employed males are more than employed females. The proportion of the working age population that is employed is referred to as the employment to population ratio (34.6 percent).

1. Introduction

1.1 The Namibia Labour Force Survey 2008 is the fourth comprehensive labour force survey to be conducted in Namibia since Independence. The Namibia Labour Force Survey (NLFS) 2008 like all other previous ones is an important component of the National Household Survey Programme which is put on the priority list by the Government of the Republic of Namibia because of the needed data on labour force characteristics.

The survey was conducted nation-wide and covered all thirteen regions. The statistics from the survey is presented by:

- a) regions
- b) rural/urban parts of the country
- c) socio-economic groups of the population
- 1.1.1 The NLFS 2008 was conducted on a sample basis covering the whole country. It provides an essential basis for the design and evaluation of overall government programmes geared towards employment creation and promotion as well as the assessment of the social effects of government employment policies.

Although a full scale survey on the informal economy was conducted in 2001 and a report of the findings is already available, it is worth noting that few questions in NLFS 2008 were asked to keep trend of the size and workforce employed in the informal economy and a brief separate chapter on findings of the informal sector economy is compiled.

Objectives of the survey

- 1.3 The Namibia Labour Force Survey 2008 provides basic data required for policy making at national and regional levels as well as for different sectors. The two main objectives for the survey were:
 - To measure the extent of available and unused labour time and human resources for the purpose of macro-economic monitoring and human resources development planning.
 - To measure the relationship between employment and other socio-economic characteristics for purposes of formulating and monitoring employment policies and programmes, income generating and monitoring schemes, vocational training and other similar programmes.

More specifically, the survey was designed to provide:

- a) Basic information on the size and structure of the country's work force.
- b) Basic elements for measuring the labour supply as well as its input and the extent to which the available human resources are utilized in the production process of the economy.
- c) A prospective basis for projections of the economically active population and its components for socio-economic planning.
- d) A basis for research in many areas ranging from testing labour market segmentation theories to formulating demographic models.
- e) To the public, information on the employment situation of the country. When properly disaggregated by geographic area, the data may provide information on the situation in local markets especially on the number of persons available in specific occupational categories.
- To the business community, useful indicators on the future course of the economy.
- g) Basic information on the size of the informal economy.

Structure of the report

1.4 Chapter 1 provides the rationale for the study and specific objectives to be achieved. Chapter 2 provides a brief description of the survey design and implementation. Chapter 3 considers the main characteristics of the Namibian population i.e. its spatial distribution, demographic characteristics, housing conditions and the sources of household incomes.

Chapter 4 focuses on the economic activity of the population. It examines the notions of employment and unemployment and provides a comparative analysis of major differences and similarities between different population groups, especially with regard to the labour force participation rate and the rate of unemployment.

Chapters 5 and 6 dwell on the characteristics of the employed and unemployed respectively. Issues relating to the measurement of underemployment are taken up in Chapter 7. The final Chapter summarizes the main findings and draws out some of their policy implications.

1.5 A series of Annex tables contain some of the more detailed data underlying the results presented in the main body of the Report. The definitions of terms used in the Report are provided in Appendix 1 and the questionnaire is reproduced in Appendix 2. The NLFS 2008 indicators at the start of the report present the main findings of the survey and are provided by national as well as regional levels. In all the tables presented in this Report, "Not reported" signifies non-response, i.e. information that was not captured, while "Don't know" refers to a response category indicating that respondents could not supply that specific information due to recall problems, etc.

This Report is prepared by the Ministry of Labour with the technical assistance of the Central Bureau of Statistics of the National Planning Commission.

2. Survey Design And Implementation

2.1 Introduction

- 2.1.1 The first full scale Labour Force Survey was carried out in 1997 under the National Household Survey Programme, which had been launched after the Government endorsed the Five Year Plan of Development of Statistics in Namibia in 1993. Other major surveys conducted under the Programme are the 1993/94 Namibia Household Income and Expenditure Survey (NHIES), the 1994/95 Namibia Agricultural Census (NAC), the 1996 Namibia Intercensal Demographic Survey (NIDS) incorporating the Mid-decade Goal Survey, and the Annual Agricultural Surveys (AAS) since 1995/96.
- 2.1.2 In addition, the Ministry of Labour has conducted a number of surveys in the field of employment and labour. These are the 1991 Labour Force Survey, the 1992/93 Establishment Survey, the 1993 Informal Sector Survey, the 1997 Labour Force Survey, the 1998 Establishment Survey, the 1999 Namibia Child Activities Survey, the 2000 Namibia Labour Force Survey, the 2001 Namibia Informal Economy Survey and the 2002 Namibia Occupational Wages Survey. Information from these and other surveys feed into the country's Labour Market Information System.
- 2.1.3 The NLFS 2008 is the fourth full scale survey of a series of surveys to be conducted at regular intervals. The main objectives of the survey as already discussed in chapter 1 are in line with the two broad objectives mentioned in international statistical standards for a comprehensive system of statistics on the economic activity of the population:

2.2 Planning and questionnaire design

- 2..2.1 The survey was conducted by the Ministry of Labour and Social Welfare (MLSW) in close collaboration with Central Bureau of Statistics (CBS) of the National Planning Commission (NPC). A technical committee consisting of members from the Central Bureau of Statistics, other line ministries and stakeholders was established to guide its planning and implementation. An Inter-Agency Committee and officers from the Ministry of Labour handled the technical issues of the survey. Officers from the Ministry of Labour and Social Welfare (MLSW) handled field logistics. The management of the MLSW was kept fully informed of developments on a regular basis.
- 2..2.2 The questionnaire was designed by the Technical Committee of the Ministry of Labour and Social Welfare in consultation with various users and producers of labour statistics. The definitions, concepts and phrasing of questions were discussed in detail using international, regional as well as country documentation and experiences. Draft manuals were developed concurrently with the design of the questionnaire. As there was no time for a full-scale pilot survey covering different parts of the country, a pre-test of the questionnaire was carried out in Khomas region. Based on the lessons of this exercise the questionnaire and draft manuals were revised. Fieldwork plans were drawn up and all other logistical aspects were examined in detail as time permitted.

2.3 Sample design

The target population consists of private households in Namibia. The survey intended to collect data pertaining to individuals and households of the target population. The population living in institutions such as hospitals, hostels, barracks and prisons were not covered by the survey. But if there were any private households within the institutions they were also covered. According to the 2001 Population and Housing Census, the size of the institutional population in 2001 was about 57 000 persons.

2.3.1 Sample design

The sample design for the survey was a stratified two-stage probability sample where the first stage units were geographical areas designated as the Primary Sampling Units (PSUs) and the second stage units were the households. The first stage units were selected from the sampling frame of PSUs and the second stage units were selected from a current list of households within the PSU, which was compiled just before the interviews for the survey.

2.3.2 The Master Sample Frame and stratification

The national sampling frame, which is maintained by the Central Bureau of Statistics (CBS), is based on the enumeration areas (EAs) of the 2001 Population and Housing Census and the households within the EAs. One PSU could be an EA, Part of an EA or more than one EA. The frame was stratified first by regions and then by urban/rural areas within each region. PSUs in the urban areas were further stratified into the high, middle or low levels of living according to the geographical location and the level of housing. In the regions where these levels contain large number of PSUs separate strata were made, while in the other regions a combined list of PSUs ordered by the levels was made. In the rural areas large proclaimed settlements and villages were stratified separately while the others were combined with the communal area PSUs. Communal and commercial area PSUs were grouped separately and combined to form one list for the rural strata. After all the above groupings the PSUs were geographically ordered within the strata.

2.3.3 Sample size and the master sample

Sample size was determined in order to make reliable estimates at the National urban/ rural and region level. This requirement was satisfied by the Master Sample, which is designed by the CBS to be used for number of surveys and hence was used for this survey also. This is actually the first stage sample, which consists of 239 PSUs. The number of households per PSU was fixed at 25. Additions to the number of sample households within the PSU would not add much to the improvement of the precision but would only increase the cost. The final sample consisted of 5,975 households in 239 PSUs.

2.3.4 Sample allocation

The PSUs were first allocated to the major domains of estimation (regions) proportional to their population sizes (Number of households). Then further allocation was carried out for separate strata within the major domains. The distribution of the sample PSUs and the households are given below.

Table 2. Distribution of PSUs, households and the sampling fraction

| Region | No | of sample PS | Us | No of hous | seholds in | Sampling |
|--------------|-------|--------------|-------|------------|------------|--------------|
| | Urban | Rural | Total | Population | Sample | fraction (%) |
| Caprivi | 4 | 9 | 13 | 16,974 | 325 | 1.91 |
| Erongo | 20 | 5 | 25 | 33,011 | 625 | 1.89 |
| Hardap | 8 | 6 | 14 | 16,113 | 350 | 2.17 |
| Karas | 10 | 5 | 15 | 15,595 | 375 | 2.40 |
| Kavango | 5 | 11 | 16 | 31,274 | 400 | 1.28 |
| Khomas | 37 | 3 | 40 | 64,894 | 1000 | 1.54 |
| Kunene | 5 | 6 | 11 | 13,319 | 275 | 2.06 |
| Ohangwena | 2 | 17 | 19 | 36,246 | 475 | 1.31 |
| Omaheke | 4 | 9 | 13 | 12,722 | 325 | 2.55 |
| Omusati | 2 | 14 | 16 | 38,850 | 400 | 1.03 |
| Oshana | 12 | 11 | 23 | 31,235 | 575 | 1.84 |
| Oshikoto | 5 | 11 | 16 | 28,481 | 400 | 1.40 |
| Otjozondjupa | 11 | 7 | 18 | 26,672 | 450 | 1.69 |
| Namibia | 125 | 114 | 239 | 365,386 | 5975 | 1.64 |

2.3.5 Sample selection

At the first stage PSUs were selected using probability proportional to size where the size measure is the number of households as at the 2001 Population and Housing Census, coupled with the systematic sampling procedure. At the second stage households were selected using the systematic sampling procedure from a current list of households within the PSU, which was compiled just before the interviews for the survey. The extensive stratification of the frames together with the systematic sampling procedure enhanced the representation of different types of sub-population groups in the sample.

2.4 Estimation procedure

2.4.1 Estimators

Various types of population parameters can be estimated from the sample as follows.

A. A total is estimated by the following estimator:

$$\hat{Y} = \sum_{h=1}^{L} \sum_{i=1}^{n_h} \sum_{j=1}^{m_{hi}} w_{hij} y_{hij}$$

where

$$w_{hij} = \frac{M_h}{n_h M_{hi}} \frac{M'_{hi}}{m_{hi}}$$
 (Final weight = First-stage weight x Second-stage weight);

 M_h = number of households in hth stratum according to census;

 M_{hi} = number of households in ith PSU in hth stratum according to census;

 n_h = number of PSUs sampled from the hth stratum;

 M'_{hi} = number of households in ith PSU in hth stratum according to survey listing; and

 m_{hi} = number of households in the sample from ith PSU in hth stratum.

B. A ratio is estimated by

$$\hat{R} = \frac{\hat{Y}}{\hat{X}}$$

where \hat{X} is estimated in the same way as \hat{Y} .

- C. An average is in effect a ratio of two estimates, an estimate of the total \hat{Y} and an estimate of the total number of units (households, individuals, etc.). An average can thus be estimated in the same way as a ratio, where the variable X takes the value of 1 for all units.
- D. A *proportion*, too, can be estimated as a ratio. In this case the variable Y takes the value of 1 if the unit belongs to the specific group, and 0 otherwise. The variable X takes the value of 1 for all units.

2.4.2 Weighting

As seen above, sample data are weighted to produce the estimates of population parameters. Sample weights were calculated based on the probabilities of selection at each stage. First stage weight was calculated using the sample selection information from the sampling frame. In the case of the second stage some households out of the selected 25 households in a PSU did not participate in the survey due to refusals or non-contact etc. Such non-responding households were not too large in number and there was no evidence to suggest that the excluded households were quite different from the responding ones. Hence it was assumed that the non-responding households were randomly distributed and the second stage weights were adjusted accordingly. The result of this adjustment was that the responding households were used instead of the selected 25 households in the calculation of the second stage weights. The final sample weight was the product of the first and the second stage weights. These final sample weights were incorporated into the database so that raising the sample data would be automatically carried out when the tables were produced.

2.4.3 Estimation of totals

Estimated total population was too high compared to the projected population for 2008 which was the only source for comparison at the time of analysis. This indicates that the sampling weights

were too high as a result of possible errors in listing of households in PSUs. A correction was applied to the sampling weights across all strata based on the total number of households derived from the population projections. Population projections which are based on 2001 Population and Housing Census are produced only at regional level and include the institutional population. Hence the projected household population for urban and rural strata was estimated based on the regional projections for 2008. This process may underestimate the total population in some urban strata where the in migration rate is high since such short term factors are not well represented in the computation of population projections.

The correction factor a_h is given by

$$a_h = \frac{M_h}{\widehat{M}_h}$$

Where

 $M_{\pi} = True population total$

 $\widehat{M}_h = E$ stimated population total from the survey

The adjusted sampling weight will be

$$w_{hij}^* = a_h * w_{hij}$$

2.5 Fieldwork

- 2.5.1 With 25 sample households in each PSU, it was decided to establish teams consisting of four interviewers and a supervisor to handle the workload. As a rule, five PSUs were allocated to each team. However, in cases where travel distances between and within PSUs were too large, only three or four PSUs were allocated to the team. In total 52 teams were established. There were thus 52 supervisors and 208 interviewers required.
- 2.5.2 As in NLFS 2004, editing and coding of the questionnaires took place in regional centers. Each of the 13 regions was assigned two (2) editors/coders. Thus the total number of temporary field staff required (supervisors, interviewers and editors/coders) was 288. All were recruited from and worked on the survey in their own region.
- 2.5.3 Supervision was exercised at different levels. At the first level, the *team supervisor* was the immediate supervisor to the interviewers. At the next level was the *regional supervisor* who was in charge of all the fieldwork in the region and the editing and coding staff. Labour officers of the Ministry of Labour and Social Welfare (MLSW) were appointed as regional supervisors. Finally, the *national supervisor* who was appointed by the Ministry of Labour and Social Welfare was an overall supervisor for all activities within the allocated region.

A one-week training course was held in Windhoek for the team and regional supervisors. The training of interviewers and coders took place at five different centers at the same time to ensure uniformity. The team supervisors and the regional supervisors also assisted during the one-week training of interviewers.

2.5.4 The field operation consisted of two main activities: the listing of households in the sampled PSUs and interviewing the randomly selected households. The total time allocated for fieldwork was one month. The editing and coding process started about a week later than the fieldwork and ran in parallel. Questionnaires that required further clarification were identified during this process and handed back to the teams for follow-up with the concerned households. As with fieldwork, editing and coding too was expected to take about a month. As the reference night for this survey was fixed on the night of 15 August 2004, the fieldwork started on 16 August 2004.

2.6 Data processing

- 2.6.1 Manual processing was done in the field. Therefore the information from the field was ready for data capture. Around 20 data entry operators were recruited and worked in different shifts for about two months. The data entry operators were temporary staff. The Census and Survey Processing System (CSPro) software, a US Census Bureau product, was used for data capture. SPSS software was used for data cleaning, tabulation and analysis together with other packages such as the Microsoft Excel.
- 2.6.2 The editing and coding of the questionnaires were handled in the regional centers. This arrangement, proved to be efficient as many of the errors made by the interviewers were detected and corrected by them before the questionnaires left the regional centers. A further benefit was the improvement of the processing speed since this process ran parallel to the fieldwork.
- 2.6.3 Substantial coding inconsistencies were nevertheless detected in the analysis stage. Since these mainly concerned the occupation and industry of employed persons, it was possible to correct them using the answers provided to related questions. The inconsistencies were primarily due to the insufficient time allocated for the training of coders, and perhaps also to inadequate time for coding itself.

2.7 Coverage and the quality of data

- 2.7.1 The quality of results from a sample survey depends on careful and thorough planning before the implementation of the survey, the correct implementation of the plan, and appropriate adjustment of the plan if unforeseen circumstances arise. The general issues concerning the planning phase of the NLFS 2008 were discussed before. This subsection discusses the question of coverage in the implementation process and its implications for the database and the quality of the data.
- 2.7.2 The question of coverage concerns the extent to which the sampling frame coincides with the target population, as well as the extent to which the units sampled provide the required information. The latter aspect of the coverage question is often referred to as the non-response problem. A distinction can be made between three types of coverage: (i) coverage of the first-stage units, i.e. PSUs; (ii) coverage of the second-stage units, i.e. households (unit non-response); and (iii) coverage of the items of the questionnaires (item non-response).
- 2.7.3 Coverage of the PSUs and the households: All PSU's selected for the survey were covered and the sample size was therefore not reduced. Five of the selected PSUs were not covered due to logistical problems. The affected regions were Khomas (3 PSUs), Kunene (1 PSU) and Ohangwena (1 PSU). In terms of households there were certain amount of non coverage which is not severe and although not all sampled households were covered during the survey, it is hoped that the characteristics of the covered households are broadly similar to those that were left out.

| Table 2.2: Coverage of ho | Table 2.2: Coverage of households by region | | | | | | | |
|---------------------------|---|-----------------------|-----------------|--|--|--|--|--|
| Region | Sampled households | Responding households | Response rate % | | | | | |
| Caprivi | 325 | 295 | 90.8 | | | | | |
| Erongo | 625 | 561 | 89.8 | | | | | |
| Hardap | 350 | 301 | 86.0 | | | | | |
| Karas | 375 | 308 | 82.1 | | | | | |
| Kavango | 400 | 375 | 93.8 | | | | | |
| Khomas | 1000 | 819 | 81.9 | | | | | |
| Kunene | 275 | 208 | 75.6 | | | | | |
| Ohangwena | 475 | 414 | 87.2 | | | | | |
| Omaheke | 325 | 295 | 90.8 | | | | | |
| Omusati | 400 | 387 | 96.8 | | | | | |
| Oshana | 575 | 540 | 93.9 | | | | | |
| Oshikoto | 400 | 356 | 89.0 | | | | | |
| Otjozondjupa | 450 | 387 | 86.0 | | | | | |
| Namibia | 5,975 | 5,246 | 87.8 | | | | | |

3. Characteristics Of The Population

3.1 Spatial Distribution

- 3.1.1 The 2008 Namibia Labour Force Survey (NLFS) collected information relating to the demographic characteristics of the Namibian population residing in private households. Households living in institutions as well as the homeless were not covered in this survey.
- 3.1.2 Total population enumerated was 1,789,933. Out of which, 1,161,917 were residing in rural areas and 628,015 were in urban areas (Table 3.1). The distribution of the population by region is also shown in the same table. The table shows that Khomas is the most populous region (15.9 percent), this is not surprising since Windhoek which is the capital city of the country is located in this region. Khomas region is the highest in terms of population numbers, followed by Ohangwena region (12.5 per cent) and Omusati and Kavango with each having 12.4 per cent.

3.2 Sex ratio

- 3.2.1 Sex ratio is the number of males per 100 females. A sex ratio of more than 100 shows an excess of males, a sex ratio of less than 100 shows that there are more females than males and a sex ratio of 100 indicates an equal number of males and females.
- 3.2.2 Table 3.2 shows that out of the enumerated population, 940,844 are females, while 849,163 are males. The table further shows the sex ratios in different regions, in rural and urban areas as well as at the national level. The sex ratio is an important indicator of migration among others.
- 3.2.3 Table 3.2 also shows the distribution of sex ratios in regions and areas. There are more females in Namibia than males, this is evident by a sex ratio of 90.2. The sex ratio of 86.9 in rural areas and a sex ratio of 96.7 in urban areas were recorded. This information is also depicted in Figure 3.1. With the exception of four (4) regions namely; Erongo, Khomas, Kunene and Omaheke, the rest of the regions show sex ratios of less than 100 indicating that there are more females than males in those regions.

3.3 Age structure

- 3.3.1 The NLFS also collected information on ages of respondents. Age is an important factor in demographic analysis as it is closely related to demographic and social processes. Migration is age selective and the school going population and labour force are concentrated in specific age groups.
- The age distribution of the population by broad age groups and by area and sex is presented in Table 3.3. It is worth noticing from this table that age groups 0-4, 5-9, 10-14 and 15-19 recorded the highest percentages, this is strong statistical evidence that Namibia has a relatively young population. Rural areas have relatively younger age structures than the urban ones (Figure 3.3).
- 3.3.3 The observation that the population of the country is young may also be made on the basis of examining the age pyramid Figure 3.2. The age pyramid has a wide base since the population is very large. Nations whose populations may be termed as "old" constitute less children and older people.

3.4 Dependency ratio

- 3.4.1 Table 3.4 shows the Age Dependency Ratios in Namibia over the years 2000 to 2008. An age ratio is defined as the ratio of children aged 0-14 and persons aged 65 years and older per 100 persons in the age group 15-64 years old (working age group).
- 3.4.2 The table further indicates that the overall dependency ratio in Namibia is 81.8 in 2008 compared to 83.5 in 2004. This means that in 2008, there are 81.8 dependents for every 100 persons with productive abilities (economically active population). The table also provides evidence of a

decrease in child dependency ratio, which is the ratio of those aged 0-14 years to those aged 15-64 years from 74.4 in 2004 to 71.1 in 2008. It is also worth observing from the table that through out the time series of the three years, dependency ratios in rural areas tend to be higher than in urban areas.

3.5 Educational Profile of the population 6 years and above.

- 3.5.1 The term education refers to the skills and knowledge acquired formally through the framework of an established schooling system. In the development of human resources, education is the most important consideration that has an overt impact on the quality of human resources in terms of their skills and knowledge.
- 3.5.2 Furthermore, the survey collected information on the highest level of education attained by respondents, this is due to the fact that educational achievements are assessed by analyzing data on the highest level of education completed. Table 3.5 shows the findings from this question.
- Table 3.5 shows that 13.6 percent of the population 6 years and above has no education, while 45.3 percent have completed Primary education. The table further indicates that only 1.2 percent of the population 6 years and above has completed University, while 0.7 percent have completed Post graduate. Findings from this table also confirm the reason why the majority of the employed people are in elementary occupations. There are no significant differences in educational attainment between females and males in the country.
- 3.5.4 The proportions of those who have no education are much higher in rural areas (16.9 percent) than in urban areas (7.7 percent), while of those who have completed senior secondary education are higher in urban areas (19.9 percent) than in rural areas (5.3 percent).

3.6 Type of Housing Units

- 3.6.1 The NLFS 2008 captures housing conditions in the country by reference to two criteria: the type of housing unit and type of housing tenure (see appendix for definitions). Table 3.6 reveals that at national level, traditional dwellings are the most common type of housing units (45.6 percent), followed by detached house (25.9 percent) and improvised housing unit (15.9 percent). The table further reveals that the least dominant types of housing units in Namibia are guest flat and part commercial/industrial (0.1 and 0.2 percent) respectively.
- Furthermore, the findings show that the dominant housing unit in urban area is detached house (46.3 percent) followed by improvised housing unit (27.5 percent). However, in the rural areas detached house and semi-detached/town house have the same percentage being the common housing units (11.7 percent), followed by improvised housing units (shacks) (7.9 percent). There are more traditional dwellings in rural areas (74.9 percent) than in urban areas (3.3 percent).
- 3.6.3 At regional level, the prevalence of the dominant type of housing unit largely depends on whether the region is predominantly urban or rural. Therefore it is against this background that the dominant type of housing unit in Ohangwena region which is predominantly rural is traditional dwelling (97.1 percent), followed by semi-detached/townhouse (0.9 percent) and by detached house (0.7 percent). By contrast, in Omaheke region which is predominantly urban, the common type of housing unit is detached house (56 percent) followed by improvised housing unit (shacks) (27.3 percent).

3.7 Housing Tenure

- 3.7.1 Table 3.7 reveals that at national level 68.8 percent of the households live in dwelling units that are owner occupied (without mortgage) and (12.0 percent) of the households live in dwelling units that are owner occupied (with mortgage). It further indicates that 9.3 percent of households live in housing units which are rented (not tied to the job).
- 3.7.2 When disaggregated by urban and rural areas, the findings reveals that a large proportion of 44.2 percent of dwelling units in urban areas are owner occupied (without mortgage) and 24.4 percent are owner occupied (with mortgage). With regards to rural areas, 85.8 percent of households

reported that they live in dwelling units that are owner occupied (without mortgage), while (3.3 percent) said that they live in dwelling units that are owner occupied (with mortgage).

3.7.3 In Erongo region 34.4 percent of households live in dwelling units that are owner occupied (without mortgage) while 29.5 percent of households live in dwelling units that are rented (not tied to the job). Furthermore, the table shows that 27.5 percent of households live in dwelling units that are occupied (with mortgage). In Karas and Otjozonjupa 15.1 and 14.6 percent of the households live in dwelling units that are provided by employer (private) without pay. Among all regions, owner occupied dwelling units without mortgage are more prevalent in Omusati region (97.7 percent).

3.8 Main source of income

- 3.8.1 Namibia is a developing country and most of its people may be earning no more than most other Africans, but its labour market displays characteristics that distinguish it from many other countries in sub-Saharan Africa. Table 3.8 reveals that a high proportion of households (41.8 percent) in Namibia depend on wages and salaries as their main source of income, followed by subsistence farming (crops and animals) with 22.4 percent and cash remittances (11.0 percent). Cash cropping is found to be the least main source of income with (0.4 percent). Households who depend on pension only account for (10.4 percent).
- 3.8.2 Most of the households in rural areas depend on subsistence farming (37.3 percent) as their main source of income, while in urban areas wages and salaries (68.8 percent) remain the main source of income for most households.
- 3.8.3 The table further shows that in Omusati region 80.3 percent of households rely on subsistence farming (crops and animals) as their main source of income, followed by wages and salaries (7.9 percent). In Khomas region the majority of the households depend on wages and salaries (73.2 percent) as their main source of income, followed by cash remittances (7.7 percent).

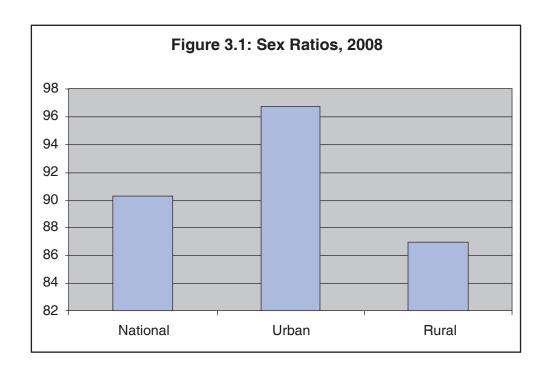

3.9 Secondary source of income

- 3.9.1 Table 3.9 reveals that the majority of households in Namibia (72.4 percent) do not have secondary source of income. However, (6.5 percent) of the households reported that cash remittances are their secondary source of income, followed by subsistence farming (crops and animals) 5.3 percent and pension (4.6 percent).
- 3.9.2 In rural areas most households (8.1 percent) depend on subsistence farming (crops and animals) as their secondary source of income while in urban areas, most of the household survive on cash remittances (4.2 percent) as their secondary source of income.
- 3.9.3 In Ohangwena region most of the households (22.8 percent) depend on subsistence farming (crops and animals) as their secondary source of income, followed by cash remittances (11.3 percent) and pension (6.6 percent). In Omusati region the majority of the households (13.3 percent) rely on pension as their secondary source of income.

3.10 Grants/Pension

- 3.10.1 Table 3.11 reveals that most of persons in households (78.5 percent) in the rural areas receive grants/pension as compared to 21.5 percent in urban area. The findings show that most of the households persons in rural areas (71 percent) expect to receive their grants/pension as compared to their counterpart in urban area (28.6 percent). Furthermore, the table reveals that most of the household persons (63.2 percent) in rural areas are not receiving the grants/pension as compared to 36.8 percent in urban areas.
- 3.10.2 At regional levels, the findings reveals that Khomas region has got the highest proportion (17.0 percent) of persons not receiving any grant/pension, followed by Kavango with (13.0 percent). Ohangwena and Omusati regions show the same percentage (11.6 percent) of persons not receiving grants/pension. Ohangwena region is the dominant region with the highest proportion (19.5 percent) of the household persons who received grants/pension, followed by Omusati (18 percent) and Oshana region (12.0 percent).

3.10.3 Table 3.11 indicates that 46.7 percent of persons in the age group 65 + receive grants/pension, followed by 14.1 percent of the households of the age group 60-64. Furthermore, the table reveals that 14.0 percent of persons in the age group 05-09 did not receive grants/pension, followed by the age group 10-14 years (12.8 percent).

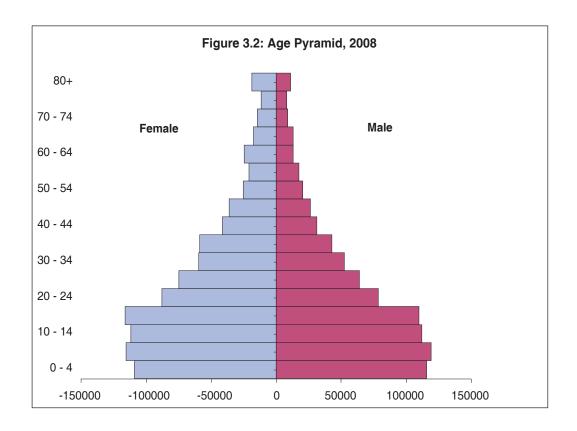

Table 3.1: Spatial distribution of the population by region and area

| Region | (No.) | (%) |
|--------------|-----------|-------|
| Caprivi | 73,379 | 4.1 |
| Erongo | 94,330 | 5.3 |
| Hardap | 65,100 | 3.6 |
| Karas | 67,353 | 3.8 |
| Kavango | 221,810 | 12.4 |

4. Economic Activity of the Population

4.1 Labour Force Framework

- 4.1.1 Enquires on the economic activity of the population divide the population into two broad categories i.e. the economically active and the inactive population. The economically active population is the employed and unemployed, also referred to as the labour force and the inactive population are those not in (outside) the labour force i.e. students, homemakers, old age, income recipient, retired and severely disabled.
- 4.1.2 According to the priority rules of the labour force frame work, employment has precedence over unemployment, and unemployment has precedence over inactivity. A person is employed when he or she has worked for pay, profit, or family gain for at least one hour during the reference period of seven days preceding the interview.

4.2 Defining Unemployment.

- 4.2.1 Unemployment can be defined in two ways; "broad or strict "sense. The difference between the two definitions depends on the inclusion of seeking work criteria. Both definitions are consistent with the principles of the labour force frame work and the usage of one has a high impact on the rate of unemployment; the broad definition always yields higher rates of unemployment than the strict.
- 4.2.2 A person is regarded as unemployed if he/she meets the three criteria of
 - (a) being without work,
 - (b) being available for work and (c) seeking work, this is in accordance with the international statistical standards.
- 4.2.3 The **broad** measure of unemployment regards all those without jobs, who are available for work and looked or did not look for work. It is inclusive of all unemployed, whether they made attempts to look for work or not.
- 4.2.4 The **strict** measure of unemployment considers those without jobs, who are available for work and are actively looking for work. It is in accordance with the international statistical standards.

4.3 The Activity Status of the Population.

- 4.3.1 Table 4.1 shows the activity status of the working age population aged (15 years and above) by area and sex. The activity status of the working population reveals that the current economically active population is 55.4 percent, while the economically inactive population is 44.6 percent.
- 4.3.2 The table further shows an uneven distribution of the labour force with 74.4 percent concentrated in urban areas while 41.5 percent is in rural areas, this concentration can be assumed to be, due to urban migration because of employment opportunities in cities and towns.

The activity status further shows that in urban areas 51.6 percent of the population is employed, while 22.8 percent is unemployed. In rural area, 22.2 percent of the population is employed, while unemployed is 19.3 percent. Further the table shows that more persons are employed in urban areas (208,075) than in rural areas (123,369), while unemployment figures are lower in urban areas (91,960) than in rural areas (107,610). According to the strict definition of unemployment the criterion of seeking for work reduced the rate of the unemployed.

4.4 Labour Force Participation Rates (LFPR)

4.4.1 The (current) labour force participation rate (LFPR), or the economic activity rate, is the proportion of the working age population (15 years and above) which is economically active, i.e. either employed or unemployed.

- 4.4.2 As indicated in table 4.2 the labour force participation rate of the working age population is 55.4 percent when the strict measure of unemployment is applied, the LFPR for the males is higher than that of the females with (275,871 or 61.6 percent), the same observation is true in urban and rural areas. The LFPR in urban areas 300,035 (74.4 percent) is higher compared to the rural areas (250,979 or 41.5 percent).
- 4.4.3 The table further indicates that a very low rate was recorded among the age group 65 years and above (5.6 percent) most of them has retired, and has left the labour market. The LFPR for the age group 35-39 is the highest (88.2 percent). In all age groups the LFPR of males dominates that of the females.
- Table 4.3 displays the comparison of labour force participation rates over time. Labour force participation rates in 2008 increased to 55.4 percent from 47.9 percent in 2004, while the rate was 54.0 percent in 2000. There are also slight differences in female and male participation in rural and urban areas. Female LFPR was 59.8 percent in urban areas and 27.9 percent in rural areas in 2004, while in 2008 the rates increased to 72.0 percent in urban areas and 35.5 percent in rural areas. Male LFPR was 73.7 percent in urban areas and 43.1 percent in rural areas in 2004, while in 2008 the LFPR is 76.9 percent in urban areas and 49.1 percent in rural areas.
- 4.4.7 Furthermore, the table shows significant differences in participation rates over various regions of the country. The participation rate was high in 2000 for Khomas and Otjozondjupa region (68.7 and 63.4 percent), in 2004 Erongo and Karas took the lead (71.4 and 71.3 percent), while in 2008 the rate was significantly high in Erongo and Omaheke region (80.1 and 77.3 percent) respectively.

4.5 Unemployment rate

- 4.5.1 Unemployment rate measures the proportion of the unemployed persons in the labour force. Table 4.4 shows that current rate of unemployment is 51.2 percent when the broad measure of unemployment is applied, and lowers to 37.6 percent when strict measure of unemployment is applied. Unemployment rate is higher in the rural areas than in urban areas. Rural unemployment is 64.9 percent (broad definition), while in urban areas is 36.4 percent and the same trend prevail when applying the strict measure of unemployment, which is 46.6 percent in rural areas and 30.6 percent in urban areas. The female unemployment rate is very high in rural areas (72.1 percent) as compared to 42.9 percent in urban areas, while male unemployment rate is higher in rural areas (56.8 percent) than in urban areas (29.9 percent).
- 4.5.2 Table 4.5 compares the unemployment rates over periods (2000, 2004 and 2008), it is observed that the strict unemployment rate has been increasing from 20.2 percent (2000) to 21.9 percent (2004) and 37.6 percent in 2008. The labour force was 541,447 in 2000 and has dropped to 493,448 in 2004, while in 2008 increased to 531,014.

4.6 The Inactive Population.

4.6.1 The inactive population are those that are not part of the labour force. This includes among others the retired, old age, illness/disabled persons, homemakers, students and the income recipients. Table 4.6 shows that the total economically inactive population is 428,173, with the majority being females (255,909) as compared to males (172,264).

5. Characteristics of the Employed

5.1 Current employed persons

- 5.1.1 The employed and unemployed population makes up the Labour Force. According to the System of National Accounts (SNA) classification and internationally recommended definition, a person is considered employed if he/she had worked for at least one hour on any economic activities within the reference period of seven days prior to the interview or was temporarily away from work but would return. Adopting the priority rules, economic activity take presidency over non economic activity.
- 5.1.2 This chapter examines the different characteristics of the employed persons as was captured during the survey. It starts by looking at the employment to population ratio by region, area and sex. The type of workplace of the employed persons is also highlighted, followed by the structure of the employed population in the major economic sectors.
- Table 5.1(a) shows that the working age population amounts to 959,187. Out of the total working age population, females (511,051) outnumbered their male counterparts (448,135). The table further reveals that out of 959,187 working age population, 331,444 or 34.6 percent were employed persons. Despite females being more than males in the working age population, more males (186,093) are employed than females (145, 351).

5.2 Employment to population ratio

- 5.2.1 The proportion of the working age population that is employed is referred to as employment ratio, also referred to as the employment rate. This indicator tends to be more stable than both the Labour Force Participation Rate (LFPR) and Unemployment Rate (UR), therefore, is seen to be a useful indicator of long term conditions in the labour market. Employment Ratio (ER) measures the rate at which working age population enters the labour force and finds employment.
- Table 5.1(c) indicates that the overall employment ratio for the persons in the working age population is 34.6 percent. Employment ratio tends to be higher in urban areas (51.9 percent) than in rural areas (22.2 percent). Males' employment ratio is higher (41.6 percent) than that of females (28.5 percent). The same scenario is prevalent in urban and rural areas, as well as in all regions. With regard to regional distribution, the regions that recorded above 50 percent employment ratios are Erongo (57.8 percent), Karas (54.3 percent) and Khomas (54.2 percent) respectively. By contrast, lower (below 20 percent) records were observed in the regions of Ohangwena (9.5 percent), Omusati (11.9 percent) and Oshikoto (19.3 percent) respectively.

5.3 Employment structure and type of workplace

5.3.1 Table 5.2(a) reflects distribution of employees in Namibia by areas, sex and type of workplace. Out of a total of 269,602 employees, 50.8 percent reported private enterprise as their workplace, followed by government (21.1 percent) and private household (13.9 percent).

The distribution of the employees shows that the majority are in urban areas (65.5 percent) as compared to rural areas (34.5 percent). In both urban and rural areas, there are more employed males than females.

- Table 5.2(b) indicates the distribution of the employed persons by industry, area and sex. Agricultural sector is found to be the main employment provider with 15.9 percent, of the total employed persons. Wholesale and retail trade accounts for 15.1 percent employed persons. In rural areas, the industry employing most people is agriculture (38.3 percent), followed by education (14.0 percent), while in urban areas, most employed persons are in wholesale and retail trade (17.2 percent), followed by private households with employed persons (12.3 percent). Industries employing the least number of persons are electricity, gas & water (1.6 percent) and fishing (0.4 percent).
- 5.3.3 Table 5.2(c) reveals the distribution of the employed persons by occupation, area and sex. It shows that most of the employed persons at national level are in elementary occupation (23.4 percent), followed by services, shops and market sales workers (18.4 percent) and craft and trade workers

(15.9 percent). Armed forces appear to be the least occupation with employed persons, this is due to the exclusion of the institutional population. The table further reveals that 23.5 percent of males are in craft and trade workers, followed by those in elementary occupations. In contrast, the majority of females (29.1 percent) are in elementary occupations (19.0 percent), followed by those in service, shops and market sales workers (23.4 percent). In urban and rural areas, the number of employed females and males vary from one occupation to the other.

- Table 5.2(d) shows employment status by area and sex. At the national level, the table reveals that out of 331,444 employed persons, 81.3 percent are employees, followed by other own account workers (without paid employees) (10.4 percent). Employment status with the least number of employed persons is other unpaid family workers (0.1 percent). Distribution of males and females in different employment status reveal that employees are dominant (82.2 and 80.3 percent respectively), followed by other own account worker (with paid employees) (8.3 and 13.0 percent respectively). The same pattern prevails in urban and rural areas.
- Table 5.3 indicates the distribution of employed persons by industry and employment status. Agriculture being the largest employment provider has the highest number of employed persons (52,788), with the majority (70.8 percent) being employees, followed by subsistence/communal farmers (without paid employees) (12.3 percent). The industry with 100 percent employees is extra territorial organizations and bodies. It is evident from the table that employees (81.3 percent) are dominant in all industries, followed by other own account workers (without paid employees) (10.4 percent).
- Table 5.4 gives a detailed distribution of the employed persons by industry and occupations. It indicates that most employed persons in elementary occupations are in private households with paid employees (29,317), followed by those in agriculture and manufacturing industries (20,530 and 5,234) respectively. Service shops and market sales workers constitute a big number of employed persons in wholesale and retail trade (21,857) industry, followed by those in public administration and hotel and restaurants (15,985 and 6,282) respectively.

Professionals are dominant in education and health and social work industries (15,543 and 5,104) respectively, which is also the case with technicians and associate professionals.

5.4 Educational profile of the employed persons

- Table 5.5 reflects the level of educational attainment of the employed persons in different industries, occupations and employment status. The table shows that most of the employed persons with no education (52.1 percent) and with primary school education (27.0 percent) are in agriculture, while those with junior secondary education (20.5 percent) dominate wholesale and retail trade, repair of motor vehicles. Employed persons with university (23.5 percent) are concentrated in education, while employed persons with post graduate degree (23.5 percent) are mostly in health and social work.
- The table further shows that employees are dominating all educational levels. Employed persons with no education dominate elementary occupations (40.2 percent), followed by those in skilled agriculture & fishery workers and craft and trade workers (24.9 and 17.0 percent) respectively. Furthermore, employed persons with primary school education are mostly in elementary occupation (35.7 percent), followed by craft and trade workers (21.8 percent). By contrast, employed persons with after standard 10 education and beyond are dominating occupations such as professionals, legislators and senior managers, as well as technicians and professional.
- Table 5.6 reveals that the majority of the employed persons at national level have attained junior secondary school (31.8 percent), followed by those with senior secondary and primary school (22.5 and 22.2 percent) respectively. Educational attainment in urban areas follow the same pattern, while in rural areas, employed persons with primary school education are dominant (30.6 percent), followed by those with junior secondary education (29.2 percent). The table further shows that employed males with primary education (36.1 percent) and those with junior secondary education (23.7 percent) are dominant in rural areas, while employed males with junior secondary education (32.3 percent) and primary school education (19.9 percent) dominate the urban areas. The same scenario is observed with employed females in both rural and urban areas.

5.5 Employed persons registered with Social Security Commission (SSC)

- Table 5.7 shows the number of employed persons registered with social security commission. Out of 331,444 employed persons, 154,665 are registered with SSC.
 Of the registered persons, 111,552 are found to be in urban areas, while 43,113 are in rural areas. Khomas region has the highest (57,237) registered employees, followed by Erongo (18,798) and Otjozondjupa (12,848). The region with the least number of registered employees is Caprivi (3,612).
- 5.5.2 Table 5.8 indicates the number of employed persons registered with SSC by industries. Out of the total registered members, 23,577 were found in education, followed by 21,564 in public administration. Wholesale and retail trade, repair of motor vehicles and agriculture recorded 16,304 and 13,585 respectively. Fishing industry has the least number of employed persons registered with SSC (513).

Most of the registered persons in urban areas are in Public administration (17,351), followed by wholesales and retail trade (14,688), while in rural areas the majorities are in education (14,079) and agriculture (11,732). Registered males amount to 86,204, while their female counterparts are 68,461. Sex distribution shows that more registered males are in urban areas (62,169) than in rural areas (24,035). The same scenario prevails with registered females, 49,382 in urban areas, while 19,079 are in rural areas.

- Table 5.9 reveals the number of employed persons who are registered with SSC by type of workplace. The table shows that private enterprise showed to have the highest number of registered employed persons (44.7 percent), followed by those in government (33.5 percent) and parastatal (12.4 percent). Non-profit organizations (1.5 percent) and cooperatives (3.7 percent) revealed to have the least number of employed persons registered with SSC. At national level, more registered males are in private enterprise (51.9 percent), followed by 26.2 percent in government, while the majority of registered female are in government (42.7 percent), and followed by those in private enterprise (35.6 percent). Private enterprise and government have shown to be the most dominant type of workplace both in rural and urban areas, with registered persons.
- Table 5.10 indicates the employed persons registered with SSC in various occupations. Elementary occupations have the highest number of employed persons (19.9 percent) registered with SSC, followed by services, shops and market sales workers and those in professional occupations (15.8 and 15.1 percent) respectively. There are more males registered with SSC in craft and trade workers (18.2 percent), followed by service, shops and market sales workers (17.0 percent). Occupations with most registered females are elementary occupations (25.1 percent), followed by professionals and clerks (21.6 and 17.2 percent) respectively. The scenario changes in urban areas, where services shops and market sales workers are dominant (16.9 percent), followed by elementary occupations (16.3 percent). In rural areas, the occupation with the highest number of employed persons registered with SSC is elementary occupations with 29.5 percent, followed by professionals (23.7 percent).
- Table 5.11 reveals the employed persons registered with SSC by age group. It also indicates the age group with most employed persons as it has shown that SSC registration is directly proportional to the size of employed persons (meaning that the more employed persons in an age group, the more they will be found to be registered with SSC). The table shows that age group 24-29 recorded the highest number of persons registered with SSC (27,110), followed by age group 30-34 with 25,502 persons and age group 35-39 with 25,087 persons. Urban areas recorded 20,453 persons for age group 25-29, while age group 35-39 with 19,099 persons. In rural areas, age group 30-34 recorded the highest number of registered persons (8,059), followed by age group 40-44 with 6,942 persons.
- 5.5.6 Furthermore, the table reveals that in all age groups more males are registered with SSC (86,204) than their female counterparts (68,461). The same situation prevails in urban and rural areas.

6. Characteristic of the unemployed

6.1 Current unemployment

- 6.1.1 The unemployed population consists of all persons (15 years and above) who are either actively seeking for work or are available for work during the reference period (a week preceding the interview). Unemployment rate is widely regarded as one of the key labour market indicators and a good measure of current economic activity. This chapter looks at different characteristics of the unemployed population in Namibia. Among others, it examines the educational profile, unemployment by region, age, duration of unemployment and means of looking for work.
- The NLFS 2008 overall unemployment rate (broad definition) is 51.2 percent which is relatively higher than 36.7 percent estimated in 2004. The strict measure of unemployment reduces the rate of unemployment to 37.6 percent compared to 21.9 per cent recorded in 2004. Table 6.1 reveals that the unemployment rate (broad definition) in rural areas is higher (46.6 percent) than in urban areas (30.6 percent). Unemployment rate by sex shows that in both measures, more females (58.4 and 43.0 percent) are unemployed compared to males (43.5 percent and 32.5 percent) respectively.

6.2 Educational profile of the unemployed persons

- Table 6.1 further provides evidence that higher levels of educational attainment reduce the rate of unemployment. The unemployment rates (strict definition) for those with qualifications beyond secondary education are lower as compared to those with secondary education and below. The unemployment rate for people with university first degree qualification is 10.2 percent at national level, 10.7 percent in urban areas and 8.3 percent in rural areas. By contrast, the unemployment rate for those with no education is 32.2 percent, the rate is higher in urban areas (35.0 percent) compared to rural areas (30.5 percent).
- Table 6.1 further shows that the unemployment rate (broad measure) for persons with primary school education and junior secondary education are high (59.9 percent and 57.3 percent) respectively. The unemployment rate for persons with no education is higher in rural areas (56.8 percent) than in urban areas (43.7 percent). It is also evident from the table that the unemployment rates for females are generally higher than their male counterparts nearly at all levels of education.
- Table 6.2 shows that 43.6 percent of the unemployed persons (strict definition) have completed junior secondary education, 26.8 percent have attained primary school education, while 7.3 per cent have no education. Most of the unemployed persons who completed junior secondary education are females (45.0 percent) than males (41.8 percent).
- When disaggregated by region, Table 6.3 reveals that 35.3 percent of the unemployed persons in Kunene region have no education followed by 34.1 percent who have primary school education. The majority of the unemployed in Kavango region have primary school (49.8 percent), while 0.3 percent have after Std 10 education. In Karas region, 51.2 percent of the unemployed persons have junior secondary education and has the highest proportion of the unemployed with teachers' training (1.3 percent).

6.3 Youth Unemployment

- 6.3.1 Given the increasing prevalence of youth unemployment, special attention is given to the unemployment rate by age group. Unemployment in Namibia does not affect all age groups the same way. The most affected age group by unemployment is that of 15-34 years. This group is referred to as **unemployed youth**, with an average unemployment rate of 59.9 percent.
- Table 6.4 shows that unemployment rates are higher in the young age groups and consistently fall in the older age groups. The unemployment rate (broad) among persons in the age group 15-19 is relatively higher (83.6 percent) than those in the age group 20-24 (67.4 percent). The unemployment rate among persons in the age group 25-29 is higher (53.3 percent) than among those in the age group 30-34 (46.0 percent).

6.4 Duration of Unemployment

- 6.4.1 Unemployment in Namibia is of long term nature. Table 6.5 shows that 72.2 percent of the unemployed have been without a job for 2 years or more, while only 11.1 percent have been without a job for the duration of 1 year. Females (75.3 percent) experience longer duration of unemployment of more than 2 years.
- 6.4.2 The table further shows the same scenario in all the regions with the majority of the unemployed being without a job for more than 2 years. Omusati region recorded 87.2 percent, Caprivi 84.8 percent, Kavango 79.2 percent and Kunene 77.9 percent of the unemployed without a job for more than 2 years.

6.5 Job Search and the Appropriate Measure of Unemployment

- 6.5.1 Out of 347,237 total unemployed persons without work and available for work, 199,570 or 57.6 percent were actively looking for work, while 146,657 or 42.4 percent were not looking for work (Table 6.6). The proportion of those looking for work is higher in urban areas (77.5 percent) compared to rural areas (47.3 percent). The table shows that 62.9 percent of males are actively looking for work compared to 53.9 percent of their female counterparts.
- Table 6.7 shows that, the dominant method of looking for work used by the unemployed persons is checking at work sites, farms, factory gates, market or other assembly places (33.7 percent), followed by direct applications to employers (29.2 percent) and seeking assistance of friends, relatives, colleagues, union (16.5 percent).
 - A small proportion (1.9 percent) of the unemployed persons looking for work reported to have taken action to start business or subsistence farming.
- Table 6.8 shows that out of 146,657 unemployed persons who were not looking for work, 50.6 percent thought no work is available, while 21.5 percent got tired of seeking work. Furthermore, the table indicates that 3.6 percent of those who did not look for work are awaiting replies, while only 0.5 percent have already found work.
- 6.5.4 Findings also reveal that out of 347,237 total of unemployed persons, 226,072 or 65.1 percent are first time job seekers or have no previous work experience. Table 6.9 shows that the majority of the first time job seekers have attained Junior secondary school (40.5 percent) followed by primary school education (32.8 percent) and senior secondary school education (14.9 percent), while 9.7 percent have no education.

6.6 Previous employment of the unemployed

- The NLFS 2008 captured information on unemployed persons who were at one stage in the past employed. Table 6.10 shows the unemployed persons by occupation of previous employment. Out of 347,237 total unemployed persons, 119,870 or 34.5 percent have previous work experience (worked before). The majority of them are females (62,601) as compared to males (57,269). Rural areas recorded a high number (66,373) of the unemployed persons with previous work experience than urban areas (53,497).
- 6.6.2 Distribution of these previous workers by their previous occupation shows that 35.0 percent of them were engaged in elementary occupations, followed by craft & trade workers and services, shops & market sales workers (19.5 percent and 19.4 percent) respectively. Female workers dominated elementary occupations (45.6 percent), while males were more concentrated in crafts & trade work (33.0 percent).
- Table 6.11 shows the distribution of the unemployed persons by industry of previous employment. It indicates that most of the unemployed persons were previously concentrated in Wholesale and Retail Trade, Repair of Motor Vehicles (23.5 percent), followed by Private Households with Employed Persons (18.9 percent) and Construction (12.2 percent). Fishing Industry recorded the least number of the previously employed persons (0.5 percent). The same pattern can be observed in both rural and urban areas.

6.6.4 The table further shows that females were mostly found in private households with employed persons and wholesale and retail trade, repair of motor vehicles (32.3 percent and 32.0 percent) respectively. Males were dominant in the construction industry (23.2 percent), followed by agriculture (14.3 percent) and wholesale and retail trade, repair of motor vehicles (14.2 percent).

6.7 Unemployment rates overtime (2000, 2004 and 2008)

Table 6.12 shows the comparison of unemployment rates over the periods 2000, 2004 and 2008. The table reflects that the rate of unemployment has been increasing over the years, the strict measure increased from 20.2 percent in 2000 to 21.9 percent in 2004 and 37.6 percent in 2008. The broad measure of unemployment increased from 33.8 percent in 2000 to 36.7 percent in 2004 and 51.2 percent in 2008. It can also be observed from the table that female unemployment rates (both measures) are generally higher than for males in all periods.

7. Underemployment

7.1 Introduction

- 7.1.1 Current international standards on the measurement of employment and unemployment, adopted by the seventeenth International Conference of Labour Statisticians (ICLS) in 2003, are recognized worldwide. Most national measures of employment and unemployment tend to converge towards these standards, allowing reasonable international comparisons of national estimates. A person is regarded as employed if he or she worked for as little as one hour during the reference period. This fact implies that some of the 'employed' population may not in fact be fully or satisfactory employed, this gives rise to various notions of 'underemployment'.
- 7.1.2 The NLFS 2008 data do allow for the measurement of some aspects in inadequate employment, as well as more comprehensive analysis of visible underemployment. This chapter therefore focuses on one such comprehensive measure and provides a preliminary assessment of its extent. The visibly underemployed persons consists of: (i) all persons in paid or self-employment, (ii) whether at work or not at work, involuntary working less than the normal duration of work determined for the activity and (iii) who were seeking or available for additional work during the reference period.
- A person is regarded as underemployed if and when a person in employment did not attain his/ her 'full employment' level in relation to the duration or productivity of work. Alternatively, a person is regarded to be underemployed when the duration or productivity of the work done is below the full employment level. A person is regarded as underemployed if that persons' job does not utilize his/her skills fully or the person is not fully occupied for the maximum number of hours during the working day. In this survey, an attempt was made to find out the extent to which underemployment is prevalent in the country.
- 7.1.4 The survey considered only those who work less or up to 35 hours per week as underemployed. The 35 hours limit was taken as it is close to the normal working hours (40) of most government and private sectors' employees.

7.2 Employed persons with part time employment

- 7.2.1 Table 7.1 illustrates employed persons with part time employment by industry and occupations. Out of 331,444 employed persons in Namibia, 61,474 or 18.5 percent are employed on a part time basis. The majority of these persons are in Elementary occupations (18,151), followed by Craft and Trade workers (15,360) and Services, Shops & market sales workers (10,831). The occupation that has the least number of persons with part time employment is Armed Forces (47), who are all in Public Administration, Defence & Social Security industry. (*Note that the survey did not cover institutional population i.e army barracks and camps, hospitals, etc.*).
- 7.2.2 The table further shows that industries such as Agriculture, Private Household (with employed persons) and Wholesale and Retail Trade, Repair of Motor Vehicles are recorded to have the highest number of employed persons with part time employment (11,474, 10,500 and 9,317) respectively. Industry with the least number of part time employees is Extra-territorial Organizations & Bodies (73).

7.3 Employed persons with full time employment

- 7.3.1 Most of the employed persons in Namibia are full time employed in their main job, as indicated in Table 7.2. The Table shows that 81.3 percent of all employed persons are full time employed. The majority of these persons are recorded as Subsistence/Communal farmers (with paid employees) with 89.4 percent, followed by Employees with 83.8 percent and other employer (with paid employees) with 80.5 percent.
- 7.3.2 The table further shows that Omaheke region recorded the highest percentage of persons employed full time (88.4 percent), Khomas and Ohangwena regions are the next highest (84.5 percent each), while Caprivi showed the lowest percentage of such persons (66.7 percent).

7.3.3 Furthermore, the table indicates that most of those employed full time are in urban areas (83.1 percent) while 78.3 percent are in rural areas. Sex distribution shows that in urban areas, 82.9 percent are males and 83.3 percent are females as compared to rural areas where 80.1 percent are males and 75.9 percent are females.

7.4 Employed persons available for and preferring to work more hours

- 7.4.1 In assessing underemployment in Namibia, the NLFS 2008 looked at the employed persons available for and preferred to work more hours by employment status, sex and area as it can be observed in Table 7.3. The table reveals that a total number of 74,207 (22.4 percent) employed persons are available for and preferring to work more hours. Among them, 48,951 (23.5 percent) are in urban areas, while 25,256 (20.5 percent) are in rural areas. Males outnumbered their female counterparts in both areas.
- 7.4.2 The table further indicates that among all the employed persons who are available for and preferring to work more hours, the majority are Employees (58,838), followed by other own account workers (9,977) and other employers with paid employees (2,067). Other unpaid family workers is reported to have the least number of employees (82) who are available for and preferring to work more hours.

7.5 Employed persons looking for additional work

- 7.5.1 Table 7.4 shows the distribution of the employed persons looking for additional work by occupations, area and sex. The table indicates that among all the employed persons (331,444), 37,520 or 11.1 percent are looking for additional work. Most of them are in Elementary occupations (9,767), followed by Services, shops & market sales workers (7,485) and Craft & Trade workers (7,278). Occupation with the least number of employed persons looking for additional work is Armed forces (79).
- 7.5.2 Furthermore, the table shows that the majority of persons looking for additional work are in urban areas (24,967 or 12.0 percent), while 12,553 or 10.1 percent are in rural areas. Males dominate their female counterparts in both areas.

7.6 Employed persons available to work more hours

- 7.6.1 Out of 331,444 employed persons in Namibia, 20,351 (6.4 percent) are working up to 35 hours per week and are available to work more hours, as indicated in Table 7.5. The majority of these persons are in urban areas (11,478), while only 8,873 are in rural areas. It can be observed from the table that females preferred to work more hours as compared to their male counterparts in both urban and rural areas.
- 7.6.2 Table 7.6 indicates that most of the employed persons who usually worked up to 35 hours per week and are available to work more hours are in Private Households with paid employees (6,621), followed by those in Agriculture (3,198) and Education (2,675). Financial Intermediation industry recorded the least number of such persons (70).
- 7.6.3 The table further reveals that Elementary occupation have the majority (7,649) of the employed persons who are usually working up to 35 hours per week and available to work for more hours. This is followed by Skilled agricultural & fishery workers and Services, shops & market sales workers with 3,251 and 2,461 respectively.
- 7.6.4 Table 7.7 shows that age group 25-29 has the majority of the employed persons who are available to work more hours (3,712), followed by age group 35-39 (3,683) and age group 30-34 (3,604), while age group 65+ recorded the least number of such persons (324). It can be observed from the table that underemployed females (58.8 percent) outnumber their male counterparts (41.2 percent).
- 7.6.5 Table 7.8 indicates the distribution of the underemployed by educational attainment and sex. It shows that employed persons with Junior Secondary education are mostly affected by underemployment

(8,013), followed by those with Primary education (5,238) and Senior Secondary education (3,262). The table further reveals that no female with Post graduate 1st degree was underemployed, as compared to males with the same educational level (33).

7.7 Employed persons with more than one job

- 7.7.1 The NLFS 2008 also captured information on employed persons who have more than one job. Table 7.9 shows that out of 331,444 employed persons in Namibia, 9,505 have more than one job, with the majority being males (4,845or 51.0 percent), while their female counterparts are 4,660 or 49.0 percent. Most of those who have more than one job are in Private Household with employed persons (1,904), followed by those in Wholesale and Retail Trade, Repair of motor vehicles (1,299) and Agriculture (1,102).
- 7.7.2 Table 7.10 looks at the age groups of the employed persons who have more than one job. The age group 35-39 indicate the highest number of such employees (1,914), followed by those in the age group 30-34 and 25-29 (1,526 and 1,350) respectively. As observed in most cases of the employed persons, males outnumbered their female counterparts. No female was recorded to have more than one job in the age group 60-64.

Main Conclusions And Policy Recommendations

- The NLFS 2008 recorded a total population of 1,789,933, of which 940,844 are females and 849,089 are males. About 64.9 percent of the Namibian population resides in rural areas. The regional distribution shows that Khomas is the most highly populated region accounting for 15.9 percent of the total population. This calls for a concerted effort by all stakeholders in regional development to identify and/or introduce more developmental programmes in rural areas in order to curb the problem of rural-urban migration.
- 2. Employment in Namibia is unevenly distributed across regions, area and by sex. The employment to population ratio varies from a low of 11.9 percent in Omusati region to a high of 57.8 percent in Erongo region. This call for special programs like the establishment of regional development funds to provide support and facilitate entrepreneurial activities in disadvantaged regions. The survey findings also revealed that the employment to population ratio is higher in urban areas (51.9 percent) than in rural areas (22.2 percent). Males have a higher (41.6 percent) employment to population ratio than females (28.5 percent).
- 3. Agriculture continues to be the main source of employment accounting for 15.9 percent of the total employment in Namibia.
- 4. Occupational distribution reflects a good deal of variability across different industrial categories. The employment composition in Agriculture is dominated by skilled agricultural workers, while Private households with employed persons have a high intake of elementary occupations. Wholesale and retail trade, repair of motor vehicles has a high number of services, shops and market sales workers. Professionals dominate education and health and social work sectors.
- 5. The unemployment situation in Namibia has not improved but rather continues to deteriorate over the years. The NLFS 2008 estimated a higher unemployment rate of 51.2 percent (broad definition) and is reduced to 37.6 percent when the strict definition is used. This is a clear indication that the country's economic and employment policies have not been sufficiently employment friendly to make a dent in the rate of unemployment. This calls for all social partners to join forces to assess past policies and devise more effective policies for job creation.
- 6. The unemployment rate is higher in rural areas (64.9 percent) than in urban areas (36.4 percent). Regional disparities are wide, with the two northern regions of Omusati and Ohangwena being the worst affected with high unemployment rate of (78.6 percent and 76.4 percent) respectively. There is a need for the establishment of regional economic development planning services, which are intended to help communities develop the local economy and generate new employment and investment by identifying and marketing regional resources, potential areas of development, and opportunities to potential investors. Such services could help to ensure the links between training provision and the development plans of the local economy through the development of local partnership.
- 7. The rate of unemployment is higher among the youth with an average rate of above 60 percent. The reason could be attributed to their low educational qualification and lack of marketable skills and job experience. This situation calls for an urgent government intervention. Special emphasis should be given to entrepreneurial skills training in order to encourage the youth to start their own income-generating projects. Relaxation of admission requirements to vocational training institutions is also necessary to absorb the increasing number of the unemployed youth. It should also be a priority to carefully assess curriculums in connection with an assessment of likely labor demand, and to link the training with the skill needs of the private sector.
- 8. High unemployment in Namibia is compounded by its long duration. The survey findings revealed that 72.2 percent of the unemployed have been without a job for 2 years or more, the majority (75.3 percent) being females as compared to (67.8 percent) males.

Appendix 1: Glossary

CHAPTER 3

A *private household* is defined as one or more persons, related or unrelated, who live together in one (or part of one) or more than one dwelling unit and have common catering arrangements. A person who lives alone and caters for himself/herself forms a one-person household.

Age was defined as the number of completed years lived by the respondent, i.e. age at last birthday.

Literacy is the ability to read and write with understanding in any language. Persons who could read and not write were classified as non-literate. Similarly, persons who were able to write and not read were classified as non-literate.

The *child dependency ratio* is the number of children aged 0-14 years divided by the working age population (15-64), expressed as a percentage. The *aged dependency ratio* is the number of persons aged 65 and older divided by the working age population, expressed as a percentage. The *overall dependency ratio* is the sum of the child dependency ratio and the aged dependency ratio.

The sex ratio is the number of males divided by the number of females, expressed as a percentage.

Educational attainment is normally defined as the highest standard, grade or years *completed*. The classification of persons into educational categories in the NLFS2008, however, is based on whether a person has *reached* a certain educational category. Thus, a person classified in the category of "primary education" has reached a certain grade within this category but has not necessarily completed primary education.

Types of housing unit

A *housing unit* is a separate and independent living premise for a household.

A detached house is a house on its own and is not attached to any other house.

A **semi-detached house/townhouse** is a house which is attached to another house or even other houses. Such a house has its own facilities and a separate entrance.

An *apartment/flat* is a self-contained living premise in a building with, usually, two or more floors. The living premises usually have a common entranceway or stairway.

A guest flat is a self-contained separate living premise, usually an outhouse of a detached house.

A *part commercial/industrial* house is a housing unit part of which is used for commercial or industrial purposes. Examples include housing units part of which is used as a bottle store, a supermarket, or a workshop.

A *mobile home (caravan, tent)* is any type of a housing unit which can be transported, i.e. it is not fixed permanently on the ground.

A single quarter is a housing unit consisting of a room or a set of rooms with shared toilet and kitchen facilities.

A *traditional dwelling* is a housing unit constructed in the various traditional styles. It can be a hut or a group of huts with or without walls, with sticks, poles, with or without thatch or grass. The ongandas fall under this category.

An *improvised housing unit (shack)* is one built with waste materials like cardboards, plastic sheets, sacking, flattened empty tins and other materials. It is generally considered unfit for human habitation.

Other housing units are those which cannot be classified into any of the above categories.

Types of housing tenure

Rented (not tied to the job): The tenure status is independent of any household member's job.

Owner occupied (with mortgage): The dwelling unit is owned by one of the household members who is still paying mortgage on it.

Owner occupied unit (without mortgage): The house is entirely owned by one of the household members and is occupied free of rent.

Rent-free (not owner occupied): The dwelling unit is not entirely owned by any of the household members and is occupied free of rent.

Provided by employer (public) with pay: The dwelling unit is provided by the Government to one of the household members, even though some rent is paid.

Provided by employer (public) without pay: The dwelling unit is provided by the Government to one of the household members, free of charge.

Provided by employer (private) with pay: The dwelling unit is provided by a private employer to one of the household members, even though some rent is paid.

Provided by employer (private) without pay: The dwelling unit is provided by a private employer to one of the household members, free of charge.

Other: Type of tenure which cannot be classified into any of the above categories.

CHAPTER 4

Type of *activity* referred to the economic activity status of the respondents during the reference period. A person was regarded as having worked if he/she worked even for one hour for pay, profit or family gain during that period. Students who, while studying, were at the same time engage in any paid, self-employment or any economic activity were considered as having worked.

The following are the definitions of the various categories of economic activity status used:

- (i) Worked: This referred to all persons aged 10 years and over who were engaged in paid or self employment or who worked for family gain.
- (ii) Did not work but had job or business: This category referred to persons who had worked in their present jobs, but who were temporarily not at work during the reference period due to sickness, vacation, drought, unpaid leave, mechanical or electrical breakdown at work place, or reduction in economic activity, etc., provided they had assurance to return to work after the short absence. Farmers and farm workers who were not working because of drought were also classified under this category.
- (iii) Unemployed:_This category refers to those persons aged 15 years and above who meet the three criteria as spelt out by international statistical standards, which are, (i) being without work (ii) being available for work, (iii) seeking or not seeking work.
- (iv) Students: This category referred to persons who were attending school during the reference period and were not engaged in any paid or self-employment and were also not available for work.
- (v) Homemakers: This category referred to persons, male and female, who during the reference period were wholly engaged in household duties and were neither engaged in any form of paid or self-employment nor worked for family gain, and who were also not available for work.
- (vi) Income recipients: This category referred to persons who were not in any paid or self-employment during the reference period but who received income from rents and investments.
- (vii) Disabled: Persons who were not in any paid or self-employment and were also not available for work because of their disability or handicap were classified under this category. However, disabled persons

who were in paid or self-employment were classified as worked. Similarly disabled persons who were looking for work or available for work were classified as unemployed (worked before) or unemployed (first time job seeker) as applicable.

- (viii) Retired/old age: This category referred to persons who were retired or pensioned and were not in any form of paid or self-employment or available for work. This category also included persons who were not working because of old age. Retired persons who were engaged in any form of paid or self-employment were classified as worked.
- (ix) Other: All other persons engaged in activities not classified in the above mentioned were classified in this category e.g., prisoners, etc.

The labour force framework

(Currently) Employed persons are those aged 15 years or more who worked for pay, profit or family gain for at least one hour during a seven-day period before the interview or who did not work during that period but had a job or business to go back to.

(Currently) Unemployed persons are those aged 15 years or more, during the seven-day period before the interview, did not work and had no job or business to go back to, but who were available for work.

The *labour force* equals the number of employed plus the number of unemployed

The (current) *labour force participation rate, or economic activity rate,* is the percentage of persons that are (currently) economically active out of all persons aged 15 years and above (the working age population).

The *unemployment rate* is the percentage of unemployed persons in the labour force.

CHAPTER 5

Employment to population ratio is employment as a percentage of the working age population, i.e. those aged 15 years or more.

Employer refers to a person who operates his or her own economic enterprise or engages independently in a profession or trade, and hires one or more paid employees.

Employee refers to a person who works for a public or private employer and receives remuneration in wages, salary, commission, piece rates, or pay in kind.

Industry refers to the type of activity carried out, goods produced, services provided or business carried out at the work place where respondents worked (if worked) or previously worked (if unemployed), during the reference period.

Occupation refers to the kind of work done and the main duties performed at the respondent.

Own account worker refers to a person who operates his or her own economic enterprise or engages independently in a profession or trade, and hires no paid employees.

Status in employment refers to the status of those who were working or had jobs but did not work during the reference period in relation to their employment, i.e. whether they were working as an employer, own account worker, employee or unpaid family worker etc.

Unpaid family worker refers to a person who works without pay in an economic enterprise operated by a related member of the same household (including peasant farmers).

CHAPTER 6

According to the **broad** or **expanded** definition of **unemployment**, the unemployed are those persons aged 15 years or more who, during the seven-day period before the interview, did not work and had no job or business to go back to, but were available for work. The **strict or narrow** definition requires further that these persons actively look for work to be considered unemployed.

Unemployed (*first time job seekers*): persons who had never worked before and were actively looking for work for the first time or were available for work if offered jobs, were classified under this category.

Unemployed (worked before): Persons who were not in any form of paid or self-employment during the referenced period, but who had worked before and were actively looking for work or were available for work if offered jobs.

Youth unemployment refers to the unemployment of those aged between 15 and 34 years.

CHAPTER 7

According to the most recent *proposals* concerning the measurement of underemployment, *underemployment* exists when a person's employment is inadequate in relation to specified norms or a possible alternative employment, account being taken of the person's willingness and abilities to perform it (ILO, 1997, p. 5).

Visibly underemployed persons comprise all employed persons, as defined above, who worked less than the normal duration of work (35-40 hours per week in all jobs held) and were willing to take up additional employment (irrespective of whether they were actively looking for additional work or not).
