

Terminalia trichopoda

Tawny Cluster-leaf

[7 records from 4 (<0.5%) squares]

Medium-sized tree. BARK rough with longitudinal fissures and light brown underbark. LEAVES obovate, **100–180 mm long**, leathery; hairy below, often with long, shaggy hairs; **petiole thick**. FLOWERS greenish-cream to pale yellow. FRUIT in heavy clusters, dull pink.

DISTRIBUTION & ABUNDANCE

Uncommon to common in the Caprivi east of 24° E. Locally abundant on the floodplain in 1724DC.

HABITAT

Found on floodplains and plains.

GROWTH FORM

A tree in the 3–8-m height category, but often in a mixed stand of shrubs and trees of all heights.

ANNUAL CYCLE

Observations only in March, November and December. FLOWERS in November. FRUIT in November and May. LEAVES present in the three months that observations were made.

CONSERVATION CONCERNS

Rare, no threats recorded.

Terminalia trichopoda, B. Curtis
